

## Getting Started

### Thank you for choosing Freenove products!

After you download the ZIP file we provide. Unzip it and you will get a folder contains several files and folders. There are three PDF files:

- **Tutorial.pdf**  
It contains basic operations such as installing system for Raspberry Pi.  
**The code in this PDF is in C.**
- **Tutorial\_GPIOZero.pdf**  
It contains basic operations such as installing system for Raspberry Pi.  
**The code in this PDF is in Python.**
- **Processing.pdf** in Freenove\_Complete\_Starter\_Kit\_for\_Raspberry\_Pi\Processing  
**The code in this PDF is in Java.**

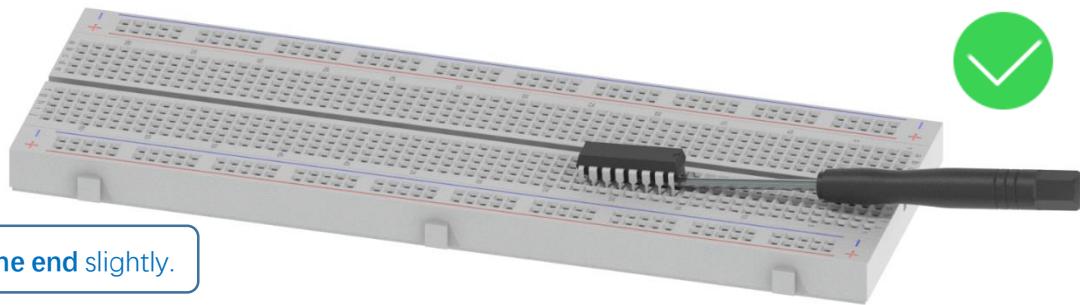

We recommend you to start with **Tutorial.pdf** or **Tutorial\_GPIOZero.pdf** first.

If you want to start with Processing.pdf or skip some chapters of Tutorial.pdf, you need to finish necessary steps in **Chapter 7 AD/DA** of **Tutorial.pdf** first.

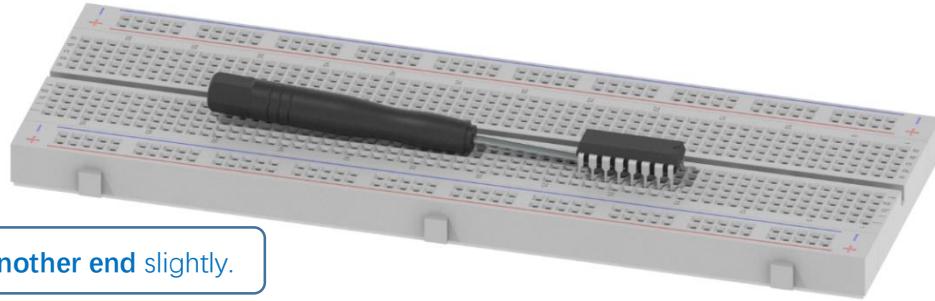

## Remove the Chips

Some chips and modules are inserted into the breadboard to protect their pins.

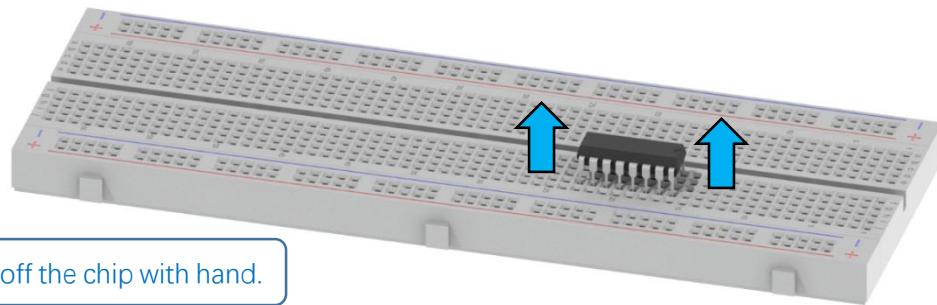

You need to remove them from breadboard before use. (There is no need to remove GPIO Extension Board.) Please find a tool (like a little screw driver) to handle them like below:

Step 1, lift **one end** slightly.

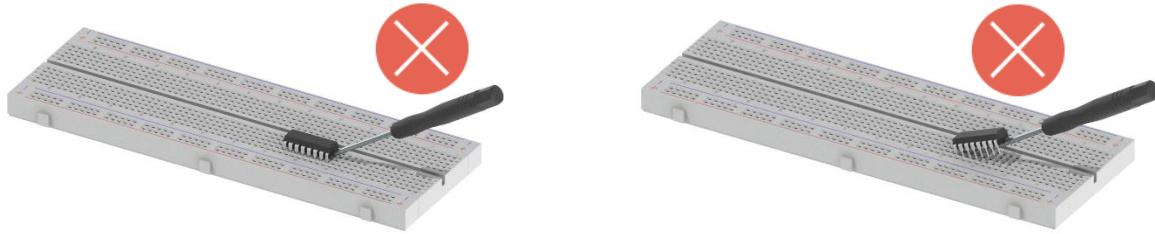

Step 2, lift **another end** slightly.

Step 3, take off the chip with hand.

Avoid lifting one end with big angle directly.

## Get Support and Offer Input

Freenove provides free and responsive product and technical support, including but not limited to:

- Product quality issues
- Product use and build issues
- Questions regarding the technology employed in our products for learning and education
- Your input and opinions are always welcome
- We also encourage your ideas and suggestions for new products and product improvements

For any of the above, you may send us an email to:

**[support@freenove.com](mailto:support@freenove.com)**

## Safety and Precautions

Please follow the following safety precautions when using or storing this product:

- Keep this product out of the reach of children under 6 years old.
- This product should be used only when there is adult supervision present as young children lack necessary judgment regarding safety and the consequences of product misuse.
- This product contains small parts and parts, which are sharp. This product contains electrically conductive parts. Use caution with electrically conductive parts near or around power supplies, batteries and powered (live) circuits.
- When the product is turned ON, activated or tested, some parts will move or rotate. To avoid injuries to hands and fingers, keep them away from any moving parts!
- It is possible that an improperly connected or shorted circuit may cause overheating. Should this happen, immediately disconnect the power supply or remove the batteries and do not touch anything until it

cools down! When everything is safe and cool, review the product tutorial to identify the cause.

- Only operate the product in accordance with the instructions and guidelines of this tutorial, otherwise parts may be damaged or you could be injured.
- Store the product in a cool dry place and avoid exposing the product to direct sunlight.
- After use, always turn the power OFF and remove or unplug the batteries before storing.

## About Freenove

Freenove provides open source electronic products and services worldwide.

Freenove is committed to assist customers in their education of robotics, programming and electronic circuits so that they may transform their creative ideas into prototypes and new and innovative products. To this end, our services include but are not limited to:

- Educational and Entertaining Project Kits for Robots, Smart Cars and Drones
- Educational Kits to Learn Robotic Software Systems for Arduino, Raspberry Pi and micro:bit
- Electronic Component Assortments, Electronic Modules and Specialized Tools
- Product Development and Customization Services**

You can find more about Freenove and get our latest news and updates through our website:

<http://www.freenove.com>

## Copyright

All the files, materials and instructional guides provided are released under [Creative Commons Attribution-NonCommercial-ShareAlike 3.0 Unported License](#). A copy of this license can be found in the folder containing the Tutorial and software files associated with this product.

This means you can use these resources in your own derived works, in part or completely, but **NOT for the intent or purpose of commercial use.**

## Preface

Raspberry Pi is a low cost, **credit card sized computer** that plugs into a computer monitor or TV, and uses a standard keyboard and mouse. It is an incredibly capable little device that enables people of all ages to explore computing, and to learn how to program in a variety of computer languages like Scratch and Python. It is capable of doing everything you would expect from a desktop computer, such as browsing the internet, playing high-definition video content, creating spreadsheets, performing word-processing, and playing video games. For more information, you can refer to Raspberry Pi official [website](#). For clarification, this tutorial will also reference Raspberry Pi as RPi, RPI and RasPi.

In this tutorial, most chapters consist of **Components List**, **Component Knowledge**, **Circuit**, and **Code**. We provide C code for each project in this tutorial. After completing this tutorial, you can learn Java by reading Processing.pdf.

This kit does not contain [\*\*Raspberry and its accessories\*\*](#). You can also use the components and modules in this kit to create projects of your own design.

Additionally, if you encounter any issues or have questions about this tutorial or the contents of kit, you can always contact us for free technical support at:

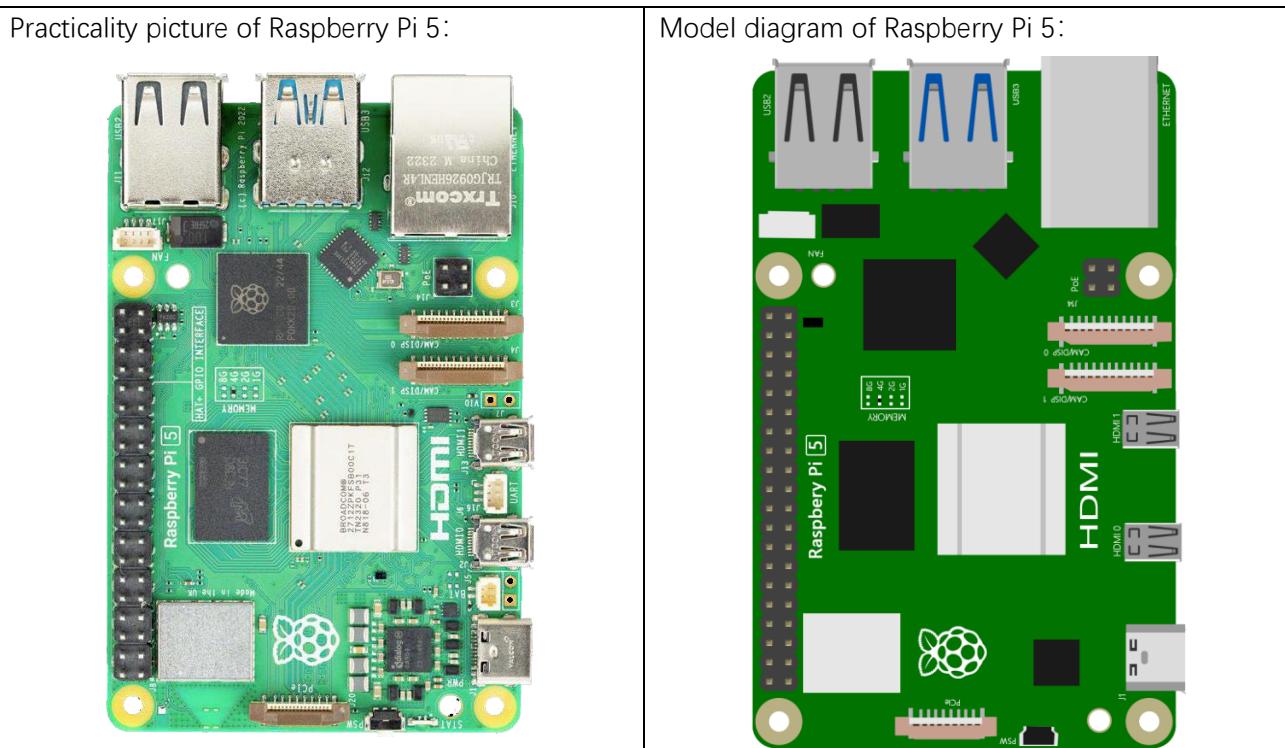

**[support@freenove.com](mailto:support@freenove.com)**

# Raspberry Pi

So far, at this writing, Raspberry Pi has advanced to its fifth generation product offering. Version changes are accompanied by increases in upgrades in hardware and capabilities.

The A type and B type versions of the first generation products have been discontinued due to various reasons. What is most important is that other popular and currently available versions are consistent in the order and number of pins and their assigned designation of function, making compatibility of peripheral devices greatly enhanced between versions.

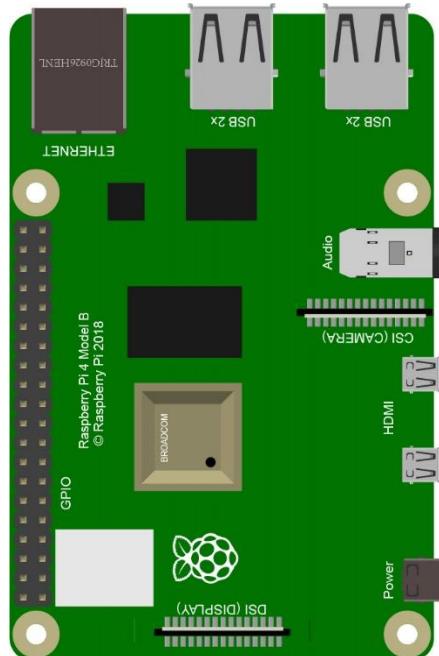

Below are the raspberry pi pictures and model pictures supported by this product. They have 40 pins.

Actual image of Raspberry Pi 4 Model B:

# Installing an Operating System

The first step is to install an operating system on your RPi so that it can be programmed and function. If you have installed a system in your RPi, you can start from Chapter 0 Preparation.

## Component List

### Required Components

Any Raspberry Pi with 40 GPIO	5V/3A Power Adapter. Note: Different versions of Raspberry Pi have different power requirements (please check the power requirements for yours on the chart in the following page.)
	

Micro or Type-C USB Cable x1	Micro SD Card (TF Card) x1, Card Reader x1
------------------------------	--

Power requirements of various versions of Raspberry Pi are shown in following table:

Product	Recommended PSU current capacity	Maximum total USB peripheral current draw	Typical bare-board active current consumption
Raspberry Pi 1 Model A	700mA	500mA	200mA
Raspberry Pi 1 Model B	1.2A	500mA	500mA
Raspberry Pi 1 Model A+	700mA	500mA	180mA
Raspberry Pi 1 Model B+	1.8A	1.2A	330mA
Raspberry Pi 2 Model B	1.8A	1.2A	350mA
Raspberry Pi 3 Model B	2.5A	1.2A	400mA
Raspberry Pi 3 Model A+	2.5A	Limited by PSU, board, and connector ratings only.	350mA
Raspberry Pi 3 Model B+	2.5A	1.2A	500mA
Raspberry Pi 4 Model B	3.0A	1.2A	600mA
Raspberry Pi 5	5.0A	1.6A (600mA if using a 3A power supply)	800mA
Raspberry Pi 400	3.0A	1.2A	800mA
Raspberry Pi Zero	1.2A	Limited by PSU, board, and connector ratings only	100mA
Raspberry Pi Zero W	1.2A	Limited by PSU, board, and connector ratings only.	150mA
Raspberry Pi Zero 2 W	2A	Limited by PSU, board, and connector ratings only.	350mA

For more details, please refer to <https://www.raspberrypi.org/help/faqs/#powerReqs>

In addition, RPi also needs an Ethernet network cable used to connect it to a WAN (Wide Area Network).

The Raspberry Pi 5 provides 1.6A of power to downstream USB peripherals when connected to a power supply capable of 5A at +5V (25W). When connected to any other compatible power supply, the Raspberry Pi 5 restricts downstream USB devices to 600mA of power.

## Optional Components

Under normal circumstances, there are two ways to login to Raspberry Pi: 1) Using a stand-alone monitor. 2) Using a remote desktop or laptop computer monitor “sharing” the PC monitor with your RPi.

## Required Accessories for Monitor

If you choose to use an independent monitor, mouse and keyboard, you also need the following accessories:

1. A display with a HDMI interface
2. A Mouse and a Keyboard with an USB interface

As to Pi Zero and Pi Zero W, you also need the following accessories:

1. A Mini-HDMI to HDMI Adapter and Cable.
2. A Micro-USB to USB-A Adapter and Cable (Micro USB OTG Cable).
3. A USB HUB.
4. USB to Ethernet Interface or USB Wi-Fi receiver.

For different Raspberry Pi Modules, the optional items may vary slightly but they all aim to convert the interfaces to Raspberry Pi standards.

	Pi Zero	Pi A+	Pi Zero W	Pi 3A+	Pi B+/2B	Pi 3B/3B+	Pi 4B	Pi 5
<b>Monitor</b>						Yes (All)		
<b>Mouse</b>						Yes (All)		
<b>Keyboard</b>						Yes (All)		
<b>Micro-HDMI to HDMI Adapter &amp; Cable</b>	Yes	No	Yes	No	No	No	No	No
<b>Micro-HDMI to HDMI Adapter &amp; Cable</b>				No			Yes	
<b>Micro-USB to USB-A Adapter &amp; Cable (Micro USB OTG Cable)</b>	Yes	No	Yes			No		
<b>USB HUB</b>	Yes	Yes	Yes	Yes	No	No	No	No
<b>USB to Ethernet Interface</b>	select one from two or select two from two		optional		Internal Integration	Internal Integration		
<b>USB Wi-Fi Receiver</b>			Internal Integration		optional			

## Required Accessories for Remote Desktop

If you do not have an independent monitor, or if you want to use a remote desktop, you first need to login to Raspberry Pi through SSH, and then open the VNC or RDP service. This requires the following accessories.

	Pi Zero	Pi Zero W	Pi A+	Pi 3A+	Pi B+/2B	Pi 3B/3B+/4B/5
<b>Micro-USB to USB-A Adapter &amp; Cable (Micro USB OTG Cable)</b>	Yes	Yes	No			NO
<b>USB to Ethernet interface</b>	Yes	Yes	Yes			

## Raspberry Pi OS

Without Screen - Use Raspberry Pi - under Windows PC: <https://youtu.be/YND0RUuP-to>

With Screen - Use Raspberry Pi - under Windows PC: <https://youtu.be/HEywFsFrj3I>

### Automatically Method

You can follow the official method to install the system for raspberry pi via visiting link below:

<https://projects.raspberrypi.org/en/projects/raspberry-pi-setting-up/2>

In this way, the system will be downloaded **automatically** via the application.

### Manually Method

After installing the Imager Tool in the **link above**. You can **also** download the system **manually** first.

Visit <https://www.raspberrypi.org/downloads/>

#### Manually install an operating system image

Browse a range of operating systems provided by Raspberry Pi and by other organisations, and download them to install manually.

[See all download options](#)

### Operating system images

Many operating systems are available for Raspberry Pi, including Raspberry Pi OS, our official supported operating system, and operating systems from other organisations.

[Raspberry Pi Imager](#) is the quick and easy way to install an operating system to a microSD card ready to use with your Raspberry Pi. Alternatively, choose from the operating systems below, available to download and install manually.

Download:  
[Raspberry Pi OS \(32-bit\)](#)  
[Raspberry Pi Desktop](#)  
[Third-Party operating systems](#)

### Raspberry Pi OS

Compatible with:

[All Raspberry Pi models](#)

#### Raspberry Pi OS with desktop and recommended software

Release date: January 11th 2021  
 Kernel version: 5.4  
 Size: 2.863MB  
[Show SHA256 file integrity hash](#)  
[Release notes](#)

[Download](#)

[Download torrent](#)

And then the zip file is downloaded.

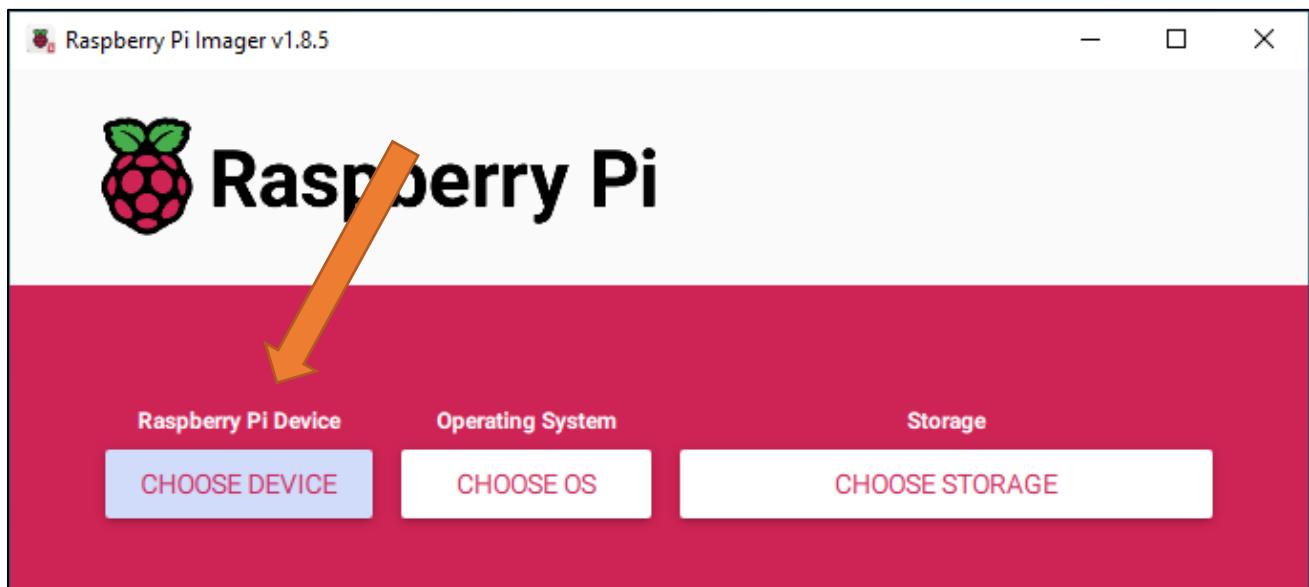

### Write System to Micro SD Card

First, put your Micro **SD card** into card reader and connect it to USB port of PC.

Then open imager toll. Clicked Choose Device.

Select a Raspberry PI Device based on your Raspberry PI version. It will help us filter out the right version of the system for the Raspberry PI.

Clicked Operating System.

Choose system that you just downloaded in Use custom.

Choose the SD card. Then click "Next".

You can configure the Raspberry Pi according to your needs.

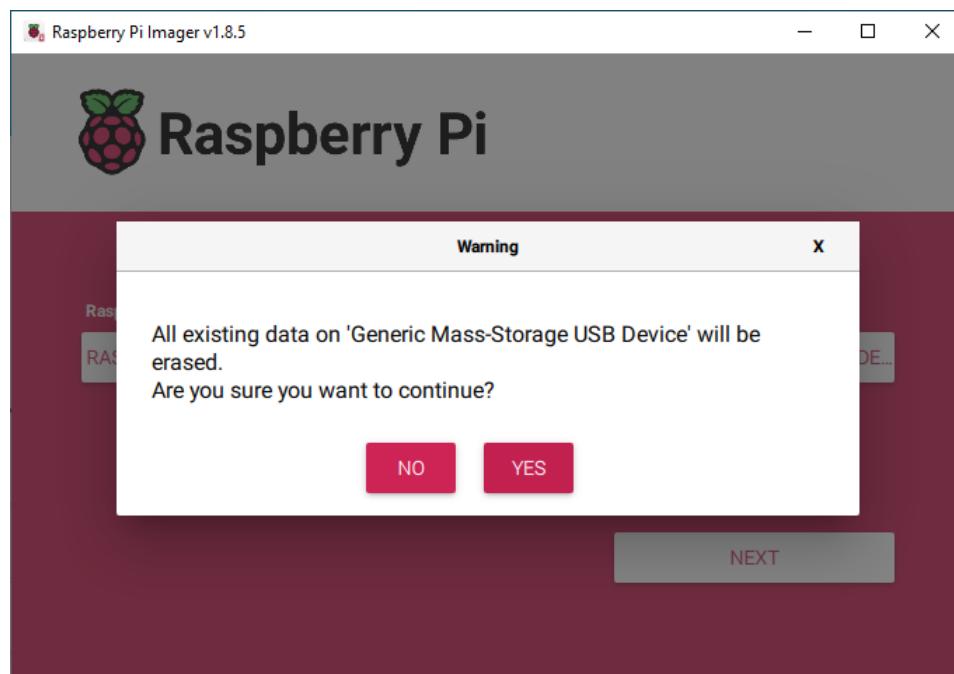

## Enable ssh and configure WiFi

On the GENERAL screen, configure your information based on your actual situation.  
Enable SSH on the SERVICES page.

Click Save, in the new screen, click Yes, wait for SD to brush into the Raspberry system.

## Insert SD card

Then remove SD card from card reader and insert it into Raspberry Pi.

Connect to the power supply and wait for the Raspberry PI to turn on.

## Getting Started with Raspberry Pi

### Monitor desktop

If you do not have a spare monitor, please skip to next section [Remote desktop & VNC](#). If you have a spare monitor, please follow the steps in this section.

After the system is written successfully, take out Micro SD Card and put it into the SD card slot of RPi. Then connect your RPi to the monitor through the HDMI port, attach your mouse and keyboard through the USB ports, attach a network cable to the network port and finally, connect your power supply (making sure that it meets the specifications required by your RPi Module Version). Your RPi should start (power up). Later, after setup, you will need to enter your user name and password to login. The default user name: pi; password: raspberry. After login, you should see the following screen.

Congratulations! You have successfully installed the RASPBERRY PI OS operating system on your RPi. Raspberry Pi 5, 4B, 3B+/3B integrates a Wi-Fi adaptor. You can use it to connect to your Wi-Fi. Then you can use the wireless remote desktop to control your RPi. This will be helpful for the following work. Raspberry Pi of other models can use wireless remote desktop through accessing an external USB wireless card.

## Remote desktop & VNC

If you have logged in Raspberry Pi via display, you can skip to [VNC Viewer](#).

If you don't have a spare display, mouse and keyboard for your RPi, you can use a remote desktop to share a display, keyboard, and mouse with your PC. Below is how to use:

[MAC OS remote desktop](#) and [Windows OS remote desktop](#).

### MAC OS Remote Desktop

Open the terminal and type following command. **If this command doesn't work, please move to next page.**

```
ssh pi@raspberrypi.local
```

The password is **raspberry** by default, case sensitive. You may need to type **yes** during the process.

```
freenove — pi@raspberrypi: ~ — ssh pi@raspberrypi.local — 80x24
[freenove@PandeMacBook-Air ~ % ssh pi@raspberrypi.local
The authenticity of host 'raspberrypi.local (240e.3b4.3810:cc80::66)' can't be e
stablished.
ED25519 key fingerprint is SHA256:P8vv8JjHarvk83rJ9ptpJ/giR2XcW11V8Lukz0xtQ0s.
This key is not known by any other names
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes ]
```

```
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added 'raspberrypi.local' (ED25519) to the list of known ho
sts.
[pi@raspberrypi.local's password:
Permission denied, please try again.
[pi@raspberrypi.local's password:
Linux raspberrypi 6.6.20+rpi-2712 #1 SMP PREEMPT Debian 1:6.6.20-1+rpi1 (202
4-03-07) aarch64

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
Last login: Thu Jun  6 08:32:41 2024 from 192.168.1.85

SSH is enabled and the default password for the 'pi' user has not been changed.
This is a security risk - please login as the 'pi' user and type 'passwd' to set
a new password.

pi@raspberrypi:~ $ ]
```

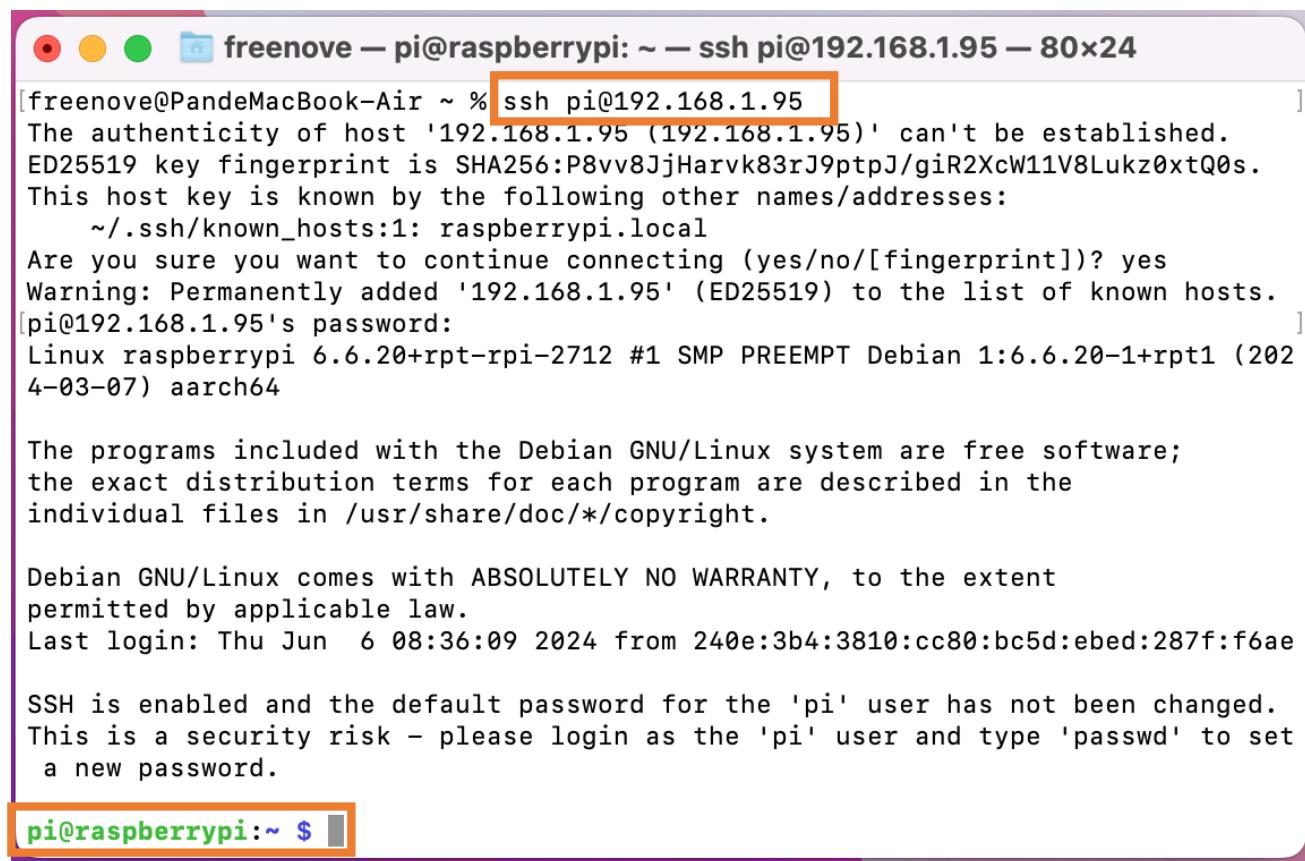

You can also use the IP address to log in Pi.

Enter **router** client to **inquiry IP address** named "raspberry pi". For example, I have inquired to **my RPi IP address, and it is "192.168.1.95"**.

Open the terminal and type following command.

```
ssh pi@192.168.1.95
```

When you see **pi@raspberrypi:~ \$**, you have logged in Pi successfully. Then you can skip to next section.

```
freenove — pi@raspberrypi: ~ — ssh pi@192.168.1.95 — 80x24
[freenove@PandeMacBook-Air ~ % ssh pi@192.168.1.95
The authenticity of host '192.168.1.95 (192.168.1.95)' can't be established.
ED25519 key fingerprint is SHA256:P8vv8JjHarvk83rJ9ptpJ/giR2XcW11V8Lukz0xtQ0s.
This host key is known by the following other names/addresses:
    ~/.ssh/known_hosts:1: raspberrypi.local
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '192.168.1.95' (ED25519) to the list of known hosts.
[pi@192.168.1.95's password:
Linux raspberrypi 6.6.20+rpt-rpi-2712 #1 SMP PREEMPT Debian 1:6.6.20-1+rpt1 (202
4-03-07) aarch64

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/*copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
Last login: Thu Jun  6 08:36:09 2024 from 240e:3b4:3810:cc80:bc5d:ebed:287f:f6ae

SSH is enabled and the default password for the 'pi' user has not been changed.
This is a security risk - please login as the 'pi' user and type 'passwd' to set
a new password.

pi@raspberrypi:~ $ ]
```

Then you can skip to [VNC Viewer](#).

## Windows OS Remote Desktop

If you are using win10, you can use follow way to login Raspberry Pi without desktop.

Press Win+R. Enter cmd. Then use this command to check IP:

```
ping -4 raspberrypi.local
```

```
C:\Windows\system32\cmd.exe
Microsoft Windows [Version 10.0.19045.4412]
(c) Microsoft Corporation. All rights reserved.

C:\Users\DESKTOP-LIN>ping -4 raspberrypi.local

Pinging raspberrypi.local [192.168.1.95] with 32 bytes of data:
Reply from 192.168.1.95: bytes=32 time=6ms TTL=64
Reply from 192.168.1.95: bytes=32 time=8ms TTL=64
Reply from 192.168.1.95: bytes=32 time=7ms TTL=64
Reply from 192.168.1.95: bytes=32 time=5ms TTL=64

Ping statistics for 192.168.1.95:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 5ms, Maximum = 8ms, Average = 6ms

C:\Users\DESKTOP-LIN>
```

Then 192.168.1.147 is my Raspberry Pi IP.

Or enter router client to inquiry IP address named "raspberrypi". For example, I have inquired to **my RPi IP address, and it is "192.168.1.95"**.

```
ssh pi@xxxxxxxxxxxx(IP address)
```

Enter the following command:

```
ssh pi@192.168.1.95
```

```
pi@raspberrypi: ~
C:\Users\DESKTOP-LIN>ssh pi@192.168.1.95
The authenticity of host '192.168.1.95 (192.168.1.95)' can't be established.
ECDSA key fingerprint is SHA256:tHbTxASRQQ/zy4CT4vSJvzAYW9FdIUPVqq7/2Bf3cIM.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '192.168.1.95' (ECDSA) to the list of known hosts.
pi@192.168.1.95's password:
Linux raspberrypi 6.6.20+rpt-rpi-2712 #1 SMP PREEMPT Debian 1:6.6.20-1+rpt1 (2024-03-07) aarch64

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/*copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
Last login: Thu Jun  6 08:39:59 2024 from 192.168.1.85

SSH is enabled and the default password for the 'pi' user has not been changed.
This is a security risk - please login as the 'pi' user and type 'passwd' to set a new password.

pi@raspberrypi: ~ $
```

## VNC Viewer & VNC

### Enable VNC

Type the following command. And select Interface Options → P5 VNC → Enter → Yes → OK. Here Raspberry Pi may need be restarted, and choose ok. Then open VNC interface.

```
sudo raspi-config
```

```
SSH is enabled and the default password for the 'pi' user has not been changed.  
This is a security risk - please login as the 'pi' user and type 'passwd' to set  
a new password.
```

```
pi@raspberrypi:~ $ sudo raspi-config
```

Then download and install VNC Viewer according to your computer system by click following link:

<https://www.realvnc.com/en/connect/download/viewer/>

After installation is completed, open VNC Viewer. And click File → New Connection. Then the interface is shown below.

Enter ip address of your Raspberry Pi and fill in a name. Then click OK.

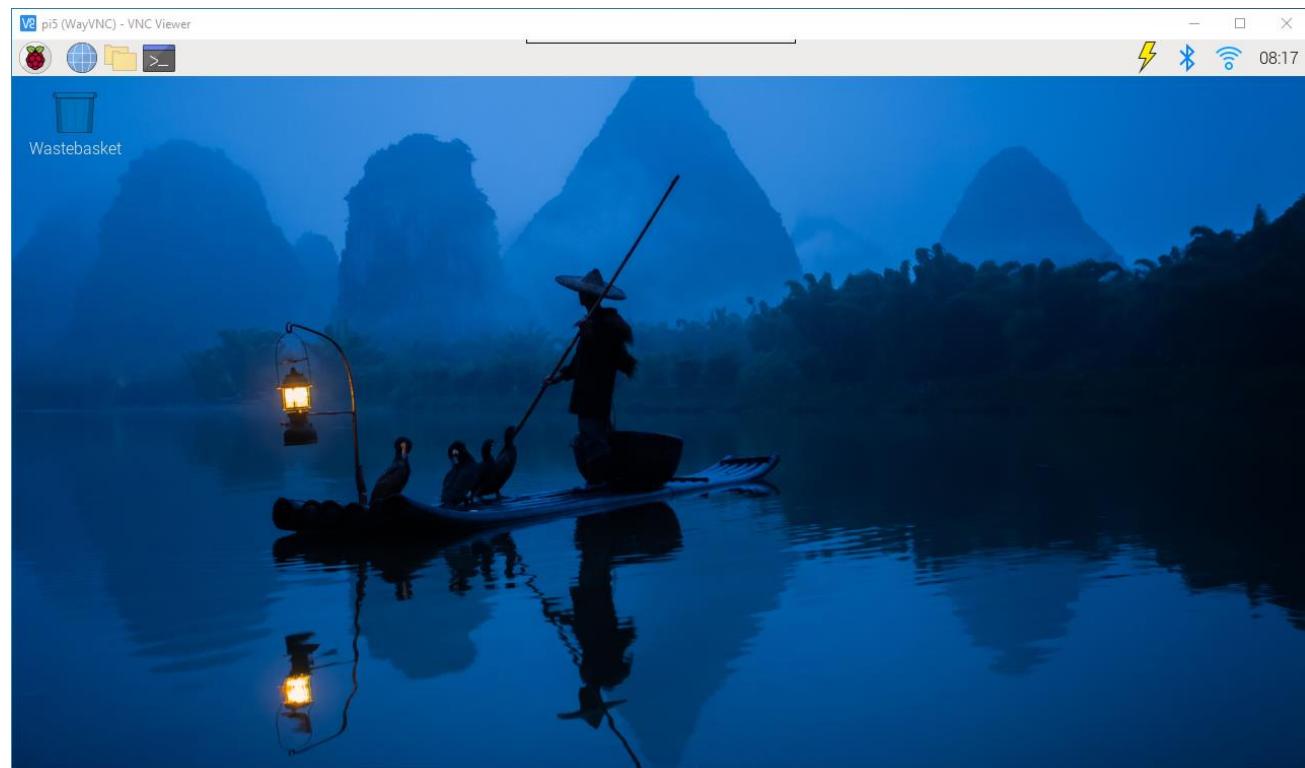

Then on the VNC Viewer panel, double-click new connection you just created,

and the following dialog box pops up.

Enter username: **pi** and Password: **raspberry**. And click OK.

Here, you have logged in to Raspberry Pi successfully by using VNC Viewer

If there is black window, please [set resolution](#).

## Set Resolution

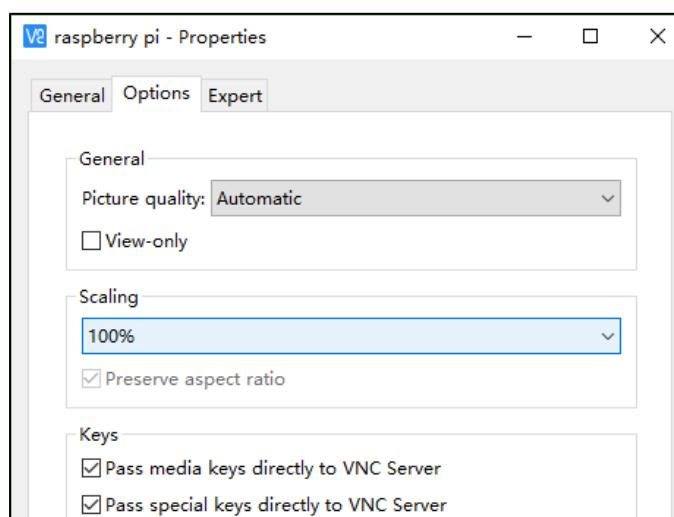

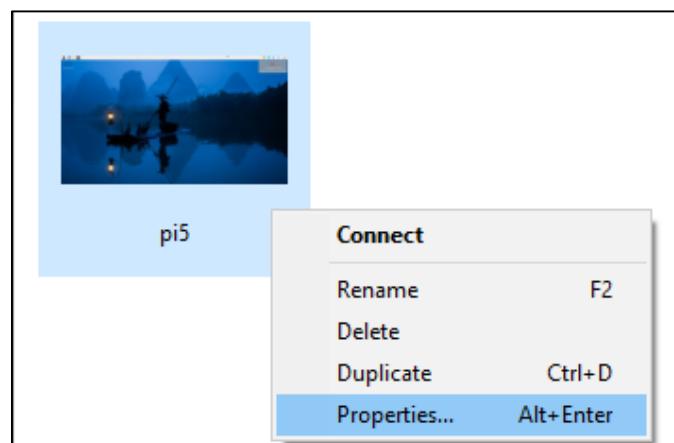

You can also set other resolutions.

If you don't know what resolution to set properly, you can try 1920x1080.

In addition, your VNC Viewer window may zoom your Raspberry Pi desktop. You can change it. On your VNC View control panel, click right key. And select Properties->Options label->Scaling. Then set proper scaling.

Here, you have logged in to Raspberry Pi successfully by using VNC Viewer and operated proper setting.

Raspberry Pi 5/4B/3B+/3B integrates a Wi-Fi adaptor. If you did not connect Pi to WiFi. You can connect it to wirelessly control the robot.

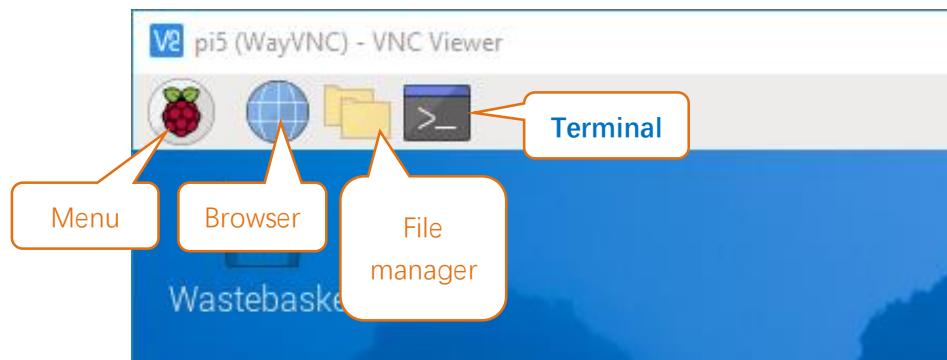

# Chapter 0 Preparation

Why “Chapter 0”? Because in program code the first number is 0. We choose to follow this rule. In this chapter, we will do some necessary foundational preparation work: Start your Raspberry Pi and install some necessary libraries.

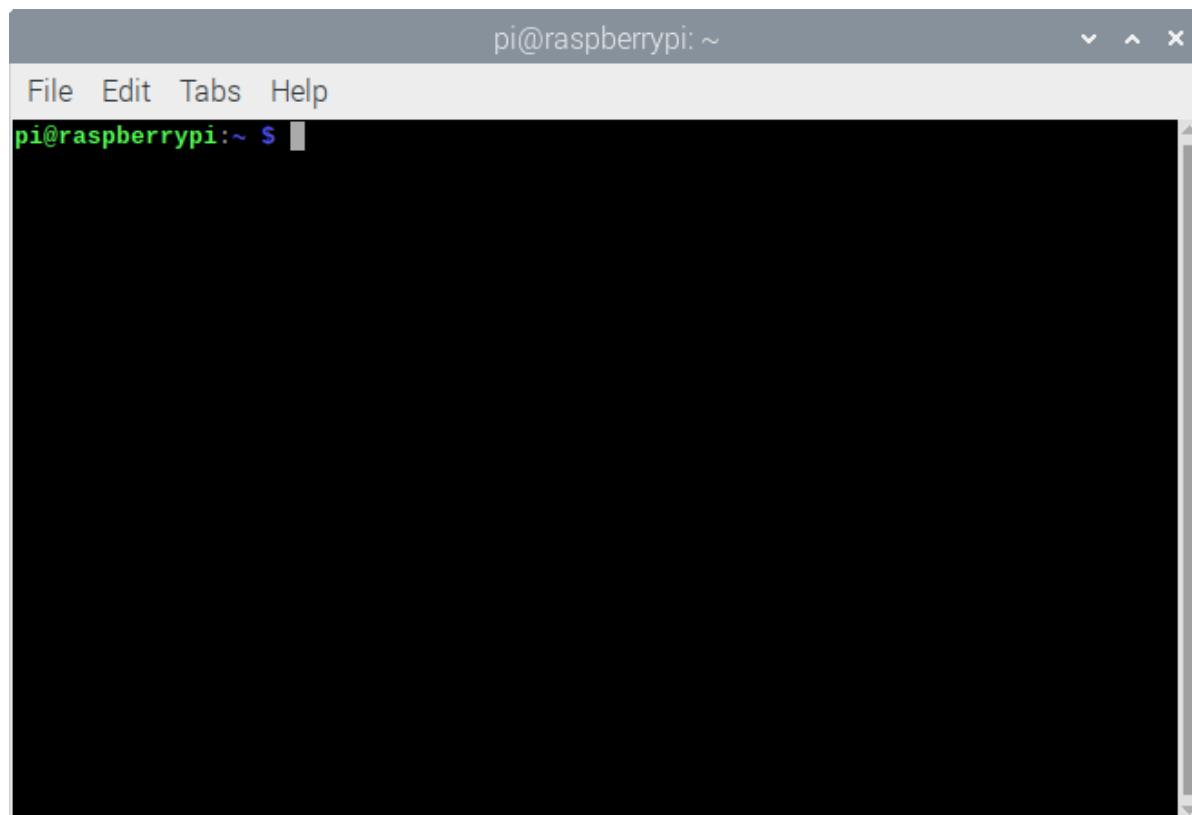

## Linux Command

Raspberry Pi OS is based on the Linux Operation System. Now we will introduce you to some frequently used Linux commands and rules.

First, open the Terminal. All commands are executed in Terminal.

When you click the Terminal icon, following interface appears.

### Note: The Linux is case sensitive.

First, type “ls” into the Terminal and press the “Enter” key. The result is shown below:

```
pi@raspberrypi: ~
File Edit Tabs Help
pi@raspberrypi:~ $ ls
Bookshelf Documents Music Public Videos
Desktop Downloads Pictures Templates
pi@raspberrypi:~ $
```

The “ls” command lists information about the files (the current directory by default).

Content between “\$” and “pi@raspberrypi:” is the current working path. “~” represents the user directory, which refers to “/home/pi” here.

```
pi@raspberrypi:~ $ pwd
/home/pi
```

“cd” is used to change directory. “/” represents the root directory.

```
pi@raspberrypi:~ $ cd /usr
pi@raspberrypi:/usr $ ls
bin games include lib local man sbin share src
pi@raspberrypi:/usr $ cd ~
pi@raspberrypi:~ $
```

Later in this Tutorial, we will often change the working path. Typing commands under the wrong directory may cause errors and break the execution of further commands.

Many frequently used commands and instructions can be found in the following reference table.

Command	instruction
<b>ls</b>	Lists information about the FILEs (the current directory by default) and entries alphabetically.
<b>cd</b>	Changes directory
<b>sudo + cmd</b>	Executes cmd under root authority
<b>./</b>	Under current directory
<b>gcc</b>	GNU Compiler Collection
<b>git clone URL</b>	Use git tool to clone the contents of specified repository, and URL in the repository address.

There are many commands, which will come later. For more details about commands. You can refer to:

<http://www.linux-commands-examples.com>

## Shortcut Key

Now, we will introduce several commonly used shortcuts that are very useful in Terminal.

1. **Up and Down Arrow Keys:** Pressing “↑” (the Up key) will go backwards through the command history and pressing “↓” (the Down Key) will go forwards through the command history.

2. **Tab Key:** The Tab key can automatically complete the command/path you want to type. When there is only one eligible option, the command/path will be completely typed as soon as you press the Tab key even you only type one character of the command/path.

As shown below, under the '~' directory, you enter the Documents directory with the "cd" command. After typing "cd D", pressing the Tab key (there is no response), pressing the Tab key again then all the files/folders that begin with "D" will be listed. Continue to type the letters "oc" and then pressing the Tab key, the "Documents" is typed automatically.

```
pi@raspberrypi:~ $ cd D
Desktop/  Documents/ Downloads/
pi@raspberrypi:~ $ cd Doc█
```

```
pi@raspberrypi:~ $ cd D
Desktop/  Documents/ Downloads/
pi@raspberrypi:~ $ cd Documents/
```

## Install WiringPi

WiringPi is a GPIO access library written in C language for the used in the Raspberry Pi.

### WiringPi Installation Steps

To install the WiringPi library, please open the Terminal and then follow the steps and commands below.

Note: For a command containing many lines, execute them one line at a time.

Enter the following commands **one by one** in the **terminal** to install WiringPi:

```
sudo apt-get update  
git clone https://github.com/WiringPi/WiringPi  
cd WiringPi  
.build
```

The screenshot shows a terminal window titled "pi@raspberrypi: ~/WiringPi". The window contains the following text:

```
pi@raspberrypi:~ $ sudo apt-get update  
Hit:1 http://archive.raspberrypi.com/debian bookworm InRelease  
Hit:2 http://deb.debian.org/debian bookworm InRelease  
Hit:3 http://deb.debian.org/debian-security bookworm-security InRelease  
Hit:4 http://deb.debian.org/debian bookworm-updates InRelease  
Reading package lists... Done  
pi@raspberrypi:~ $ git clone https://github.com/WiringPi/WiringPi  
Cloning into 'WiringPi'...  
remote: Enumerating objects: 2310, done.  
remote: Counting objects: 100% (1185/1185), done.  
remote: Compressing objects: 100% (346/346), done.  
remote: Total 2310 (delta 910), reused 1004 (delta 812), pack-reused 1125  
Receiving objects: 100% (2310/2310), 964.90 KiB | 1.78 MiB/s, done.  
Resolving deltas: 100% (1543/1543), done.  
pi@raspberrypi:~ $ cd WiringPi/  
pi@raspberrypi:~/WiringPi $ ./build
```

The following figure shows the successful installation.

```
All Done.  
  
NOTE: To compile programs with wiringPi, you need to add:  
      -lwiringPi  
      to your compile line(s) To use the Gertboard, MaxDetect, etc.  
      code (the devLib), you need to also add:  
      -lwiringPiDev  
      to your compile line(s).
```

Run the gpio command to check the installation:

```
gpio -v
```

That should give you some confidence that the installation was a success.

The screenshot shows a terminal window titled "pi@raspberrypi: ~/WiringPi". The window includes a menu bar with "File", "Edit", "Tabs", and "Help". The terminal output is as follows:

```
NOTE: To compile programs with wiringPi, you need to add:  
      -lwiringPi  
      to your compile line(s) To use the Gertboard, MaxDetect, etc.  
      code (the devLib), you need to also add:  
      -lwiringPiDev  
      to your compile line(s).  
  
pi@raspberrypi:~/WiringPi $ gpio -v  
gpio version: 3.6  
Copyright (c) 2012-2024 Gordon Henderson and contributors

  * Device tree present.  
    Model: Raspberry Pi 5 Model B Rev 1.0  
  * Supports full user-level GPIO access via memory.  
  * Supports basic user-level GPIO access via /dev/gpiomem.  
  * Supports basic user-level GPIO access via /dev/gpiochip (slow).  
pi@raspberrypi:~/WiringPi $
```

## Obtain the Project Code

After the above installation is completed, you can visit our official website (<http://www.freenove.com>) or our GitHub resources at (<https://github.com/freenove>) to download the latest available project code. We provide both **C** language and **Python** language code for each project to allow ease of use for those who are skilled in either language.

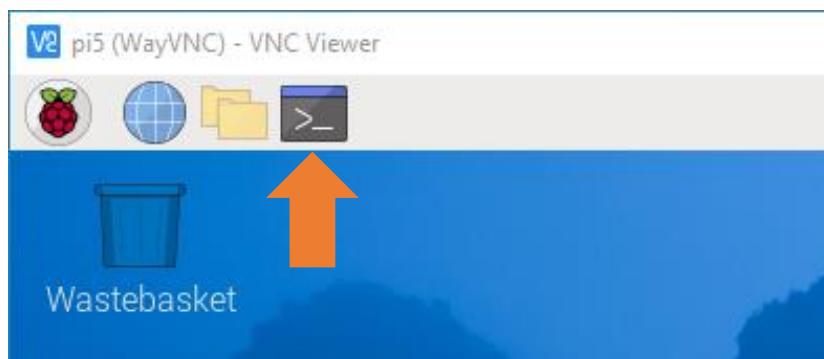

This is the method for obtaining the code:

In the pi directory of the RPi terminal, enter the following command.

```
cd
```

```
git clone --depth 1 https://github.com/freenove/Freenove_Complete_Starter_Kit_for_Raspberry_Pi
```

(There is no need for a password. If you get some errors, please check your commands.)

```
pi@raspberrypi:~
```

File Edit Tabs Help

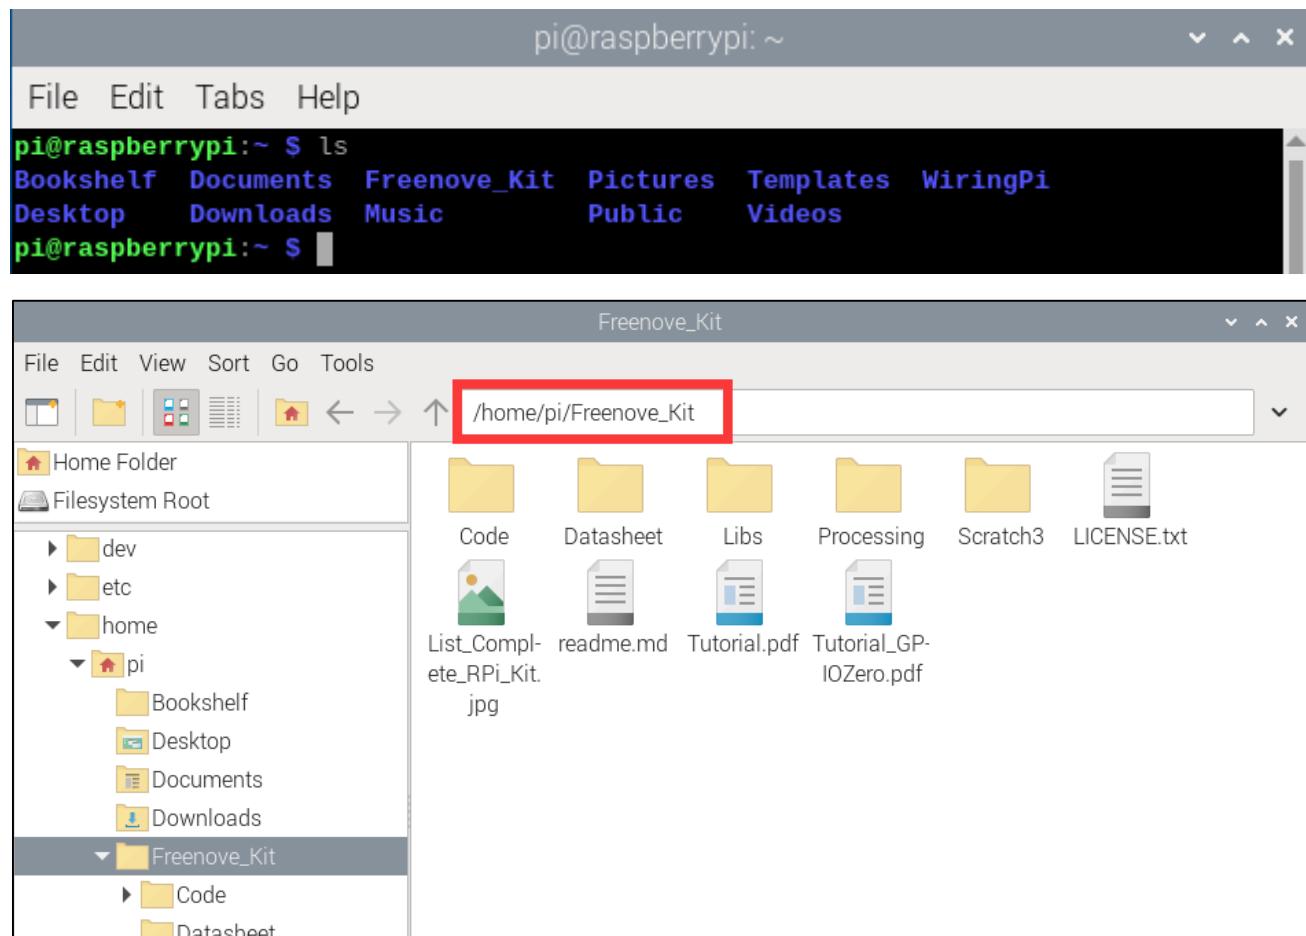

```
pi@raspberrypi:~ $ cd
pi@raspberrypi:~ $ git clone --depth 1 https://github.com/freenove/Freenove_Complete_Starter_Kit_for_Raspberry_Pi
Cloning into 'Freenove_Complete_Starter_Kit_for_Raspberry_Pi'...
remote: Enumerating objects: 666, done.
remote: Counting objects: 100% (666/666), done.
remote: Compressing objects: 100% (434/434), done.
remote: Total 666 (delta 134), reused 633 (delta 123), pack-reused 0
Receiving objects: 100% (666/666), 51.86 MiB | 4.50 MiB/s, done.
Resolving deltas: 100% (134/134), done.
pi@raspberrypi:~ $
```

After the download is completed, a new folder "Freenove\_Complete\_Starter\_Kit\_for\_Raspberry\_Pi" is generated, which contains all of the tutorials and required code.

This folder name seems a little too long. We can simply rename it by using the following command.

```
mv Freenove_Complete_Starter_Kit_for_Raspberry_Pi/ Freenove_Kit/
```

"Freenove\_Kit" is now the new and much shorter folder name.

# Chapter 1 LED

This chapter is the Start Point in the journey to build and explore RPi electronic projects. We will start with simple “Blink” project.

## Project 1.1 Blink

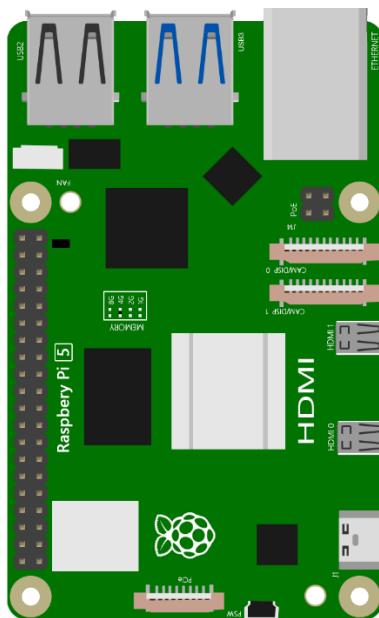

In this project, we will use RPi to control blinking a common LED.

## Component List

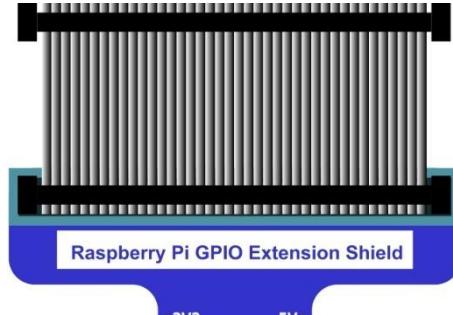

### Raspberry Pi

(Recommended: Raspberry Pi 5 / 4B / 3B+ / 3B

Compatible: 3A+ / 2B / 1B+ / 1A+ / Zero W / Zero)

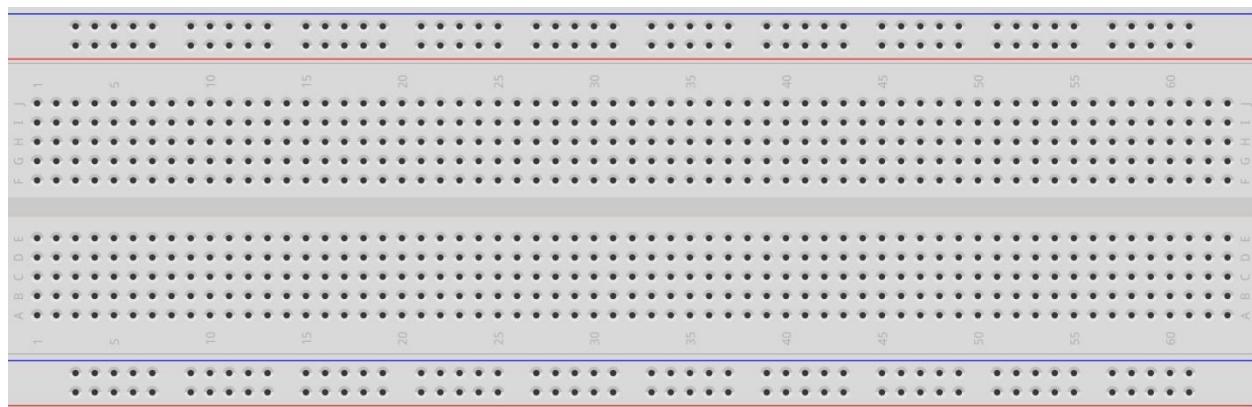

### GPIO Extension Board & Ribbon Cable

3V3	5V
SDA1	5V
SCL1	GND
GPIO4	TXD0
GND	RXD0
GPIO17	GPIO18
GPIO27	GND
GPIO22	GPIO23
3V3	GPIO24
MOSI	GND
MISO	GPIO25
SCK	CE0
GND	CE1
SDA0	SCL0
GPIO5	GND
GPIO6	GPIO12
GPIO13	GND
GPIO19	GPIO16
GPIO26	GPIO20
GND	GPIO21

### Breadboard x1

In the components list, 3B GPIO, Extension Shield Raspberry and Breadboard are necessary for each project. Later, they will be reference by text only (no images as in above).

## GPIO

GPIO: General Purpose Input/Output. Here we will introduce the specific function of the pins on the Raspberry Pi and how you can utilize them in all sorts of ways in your projects. Most RPi Module pins can be used as either an input or output, depending on your program and its functions.

When programming GPIO pins there are 3 different ways to reference them: GPIO Numbering, Physical Numbering and WiringPi GPIO Numbering.

### BCM GPIO Numbering

The Raspberry Pi CPU uses Broadcom (BCM) processing chips BCM2835, BCM2836 or BCM2837. GPIO pin numbers are assigned by the processing chip manufacturer and are how the computer recognizes each pin. The pin numbers themselves do not make sense or have meaning as they are only a form of identification. Since their numeric values and physical locations have no specific order, there is no way to remember them so you will need to have a printed reference or a reference board that fits over the pins.

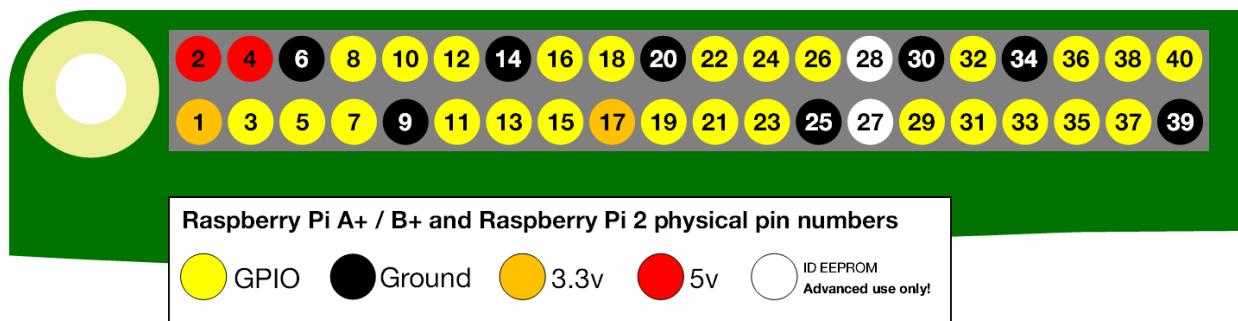

Each pin's functional assignment is defined in the image below:

For more details about pin definition of GPIO, please refer to <http://pinout.xyz/>

## PHYSICAL Numbering

Another way to refer to the pins is by simply counting across and down from pin 1 at the top left (nearest to the SD card). This is 'Physical Numbering', as shown below:

## WiringPi GPIO Numbering

Different from the previous two types of GPIO serial numbers, RPi GPIO serial number of the WiringPi are numbered according to the BCM chip use in RPi.

wiringPi Pin	BCM GPIO	Name	Header	Name	BCM GPIO	wiringPi Pin	
—	—	3.3v	1   2	5v	—	—	
8	R1:0/R2:2	SDA	3   4	5v	—	—	
9	R1:1/R2:3	SCL	5   6	0v	—	—	
7	4	GPIO7	7   8	TxD	14	15	
—	—	0v	9   10	RxD	15	16	
0	17	GPIO0	11   12	GPIO1	18	1	
2	R1:21/R2:27	GPIO2	13   14	0v	—	—	
3	22	GPIO3	15   16	GPIO4	23	4	
—	—	3.3v	17   18	GPIO5	24	5	
12	10	MOSI	19   20	0v	—	—	
13	9	MISO	21   22	GPIO6	25	6	
14	11	SCLK	23   24	CE0	8	10	
—	—	0v	25   26	CE1	7	11	
30	0	SDA.0	27   28	SCL.0	1	31	
21	5	GPIO.21	29   30	0V	—	—	
22	6	GPIO.22	31   32	GPIO.26	12	26	
23	13	GPIO.23	33   34	0V	—	—	
24	19	GPIO.24	35   36	GPIO.27	16	27	
25	26	GPIO.25	37   38	GPIO.28	20	28	
		0V	39   40	GPIO.29	21	29	

wiringPi Pin	BCM GPIO	Name	Header	Name	BCM GPIO	wiringPi Pin
-----------------	-------------	------	--------	------	-------------	-----------------

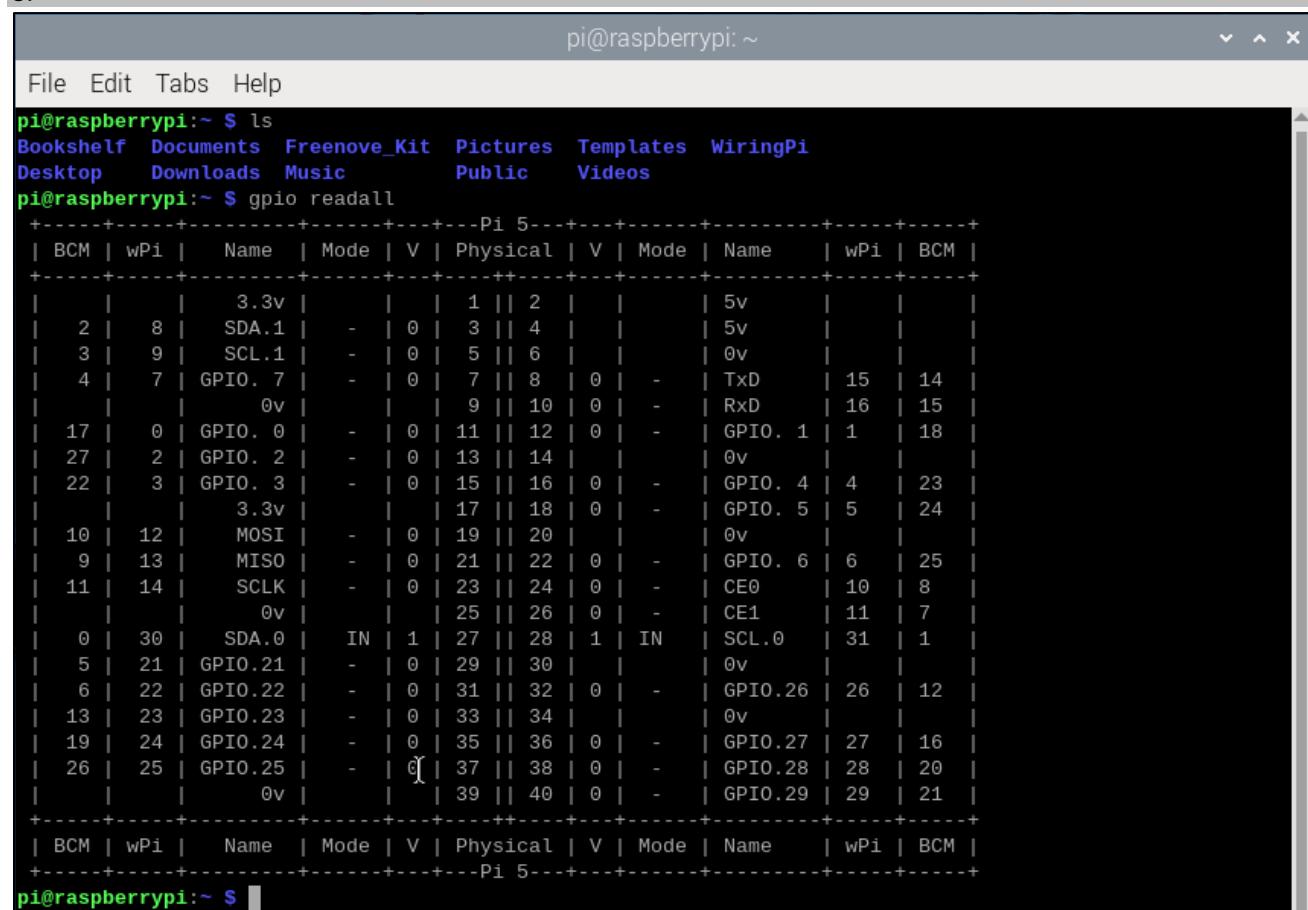

For A+, B+, 2B, 3B, 3B+, 4B, Zero

For Pi B

(For more details, please refer to <https://projects.drogon.net/raspberry-pi/wiringpi/pins/> )

You can also use the following command to view their correlation.

gpio readall

The screenshot shows a terminal window titled "pi@raspberrypi: ~". The window contains the output of the "gpio readall" command, which displays a table of GPIO pin correlations between BCM, wPi, Name, Mode, V, Physical, V, Mode, Name, wPi, and BCM. The table includes rows for various pins such as 3.3v, 5v, GND, and various GPIO pins (0-31) with their corresponding modes (IN, OUT, ALT0-ALT5), values (0 or 1), and physical pin numbers (e.g., 1, 2, 11-14, 16-18, 20-28, 30-31, 33-38). The terminal also shows the user's directory (~) and the command prompt (pi@raspberrypi:~ \$).

BCM	wPi	Name	Mode	V	Physical	V	Mode	Name	wPi	BCM
2	8	3.3v	-	0	1	2	-	5v		
3	9	SDA.1	-	0	3	4	-	5v		
4	7	SCL.1	-	0	5	6	-	0v		
17	0	GPIO. 7	-	0	7	8	0	TxD	15	14
27	2	GPIO. 0	-	0	9	10	0	RxD	16	15
22	3	GPIO. 2	-	0	11	12	0	GPIO. 1	1	18
10	12	GPIO. 3	-	0	13	14	-	0v		
9	13	MOSI	-	0	15	16	0	GPIO. 4	4	23
11	14	MISO	-	0	19	20	-	GPIO. 5	5	24
6	21	SCLK	-	0	21	22	0	0v		
13	22	0v	-	0	23	24	0	GPIO. 6	6	25
19	23	GPIO. 21	-	0	25	26	0	CE0	10	8
26	24	GPIO. 22	-	0	27	28	1	CE1	11	7
0	25	GPIO. 23	-	0	29	30	-	GPIO. 26	26	12
19	26	GPIO. 24	-	0	31	32	0	0v		
26	27	GPIO. 25	-	0	33	34	-	GPIO. 27	27	16
0	28	GPIO. 26	-	0	35	36	0	GPIO. 28	28	20
19	29	GPIO. 27	-	0	37	38	0	0v		
26	30	GPIO. 28	-	0	39	40	0	GPIO. 29	29	21

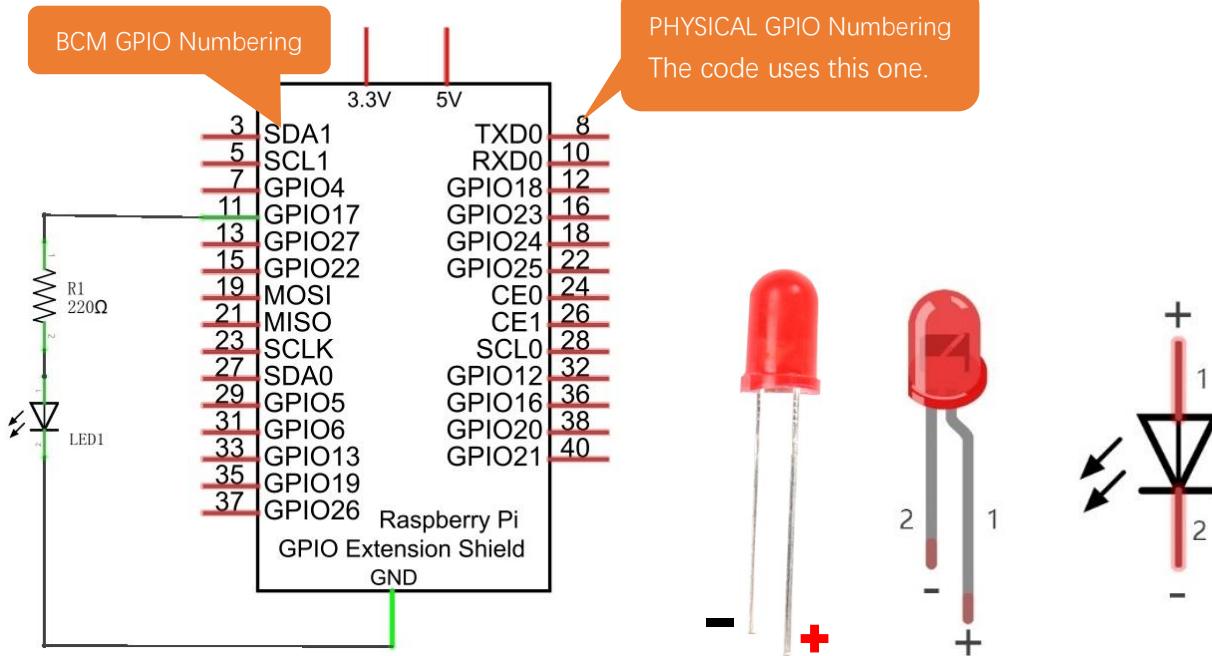

## Circuit

First, disconnect your RPi from the GPIO Extension Shield. Then build the circuit according to the circuit and hardware diagrams. After the circuit is built and verified correct, connect the RPi to GPIO Extension Shield.

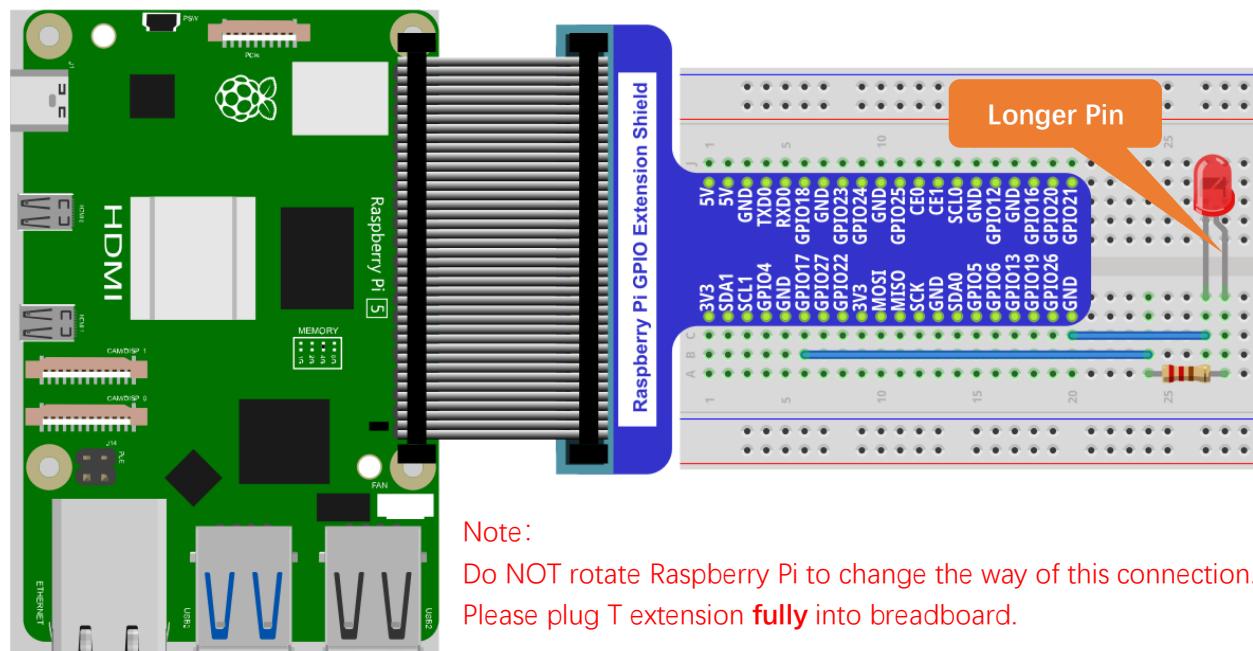

**CAUTION:** Avoid any possible short circuits (especially connecting 5V or GND, 3.3V and GND)!

**WARNING:** A short circuit can cause high current in your circuit, create excessive component heat and cause permanent damage to your RPi!

Schematic diagram

Hardware connection. **If you need any support, please contact us via: support@freenove.com**

Youtube video <https://youtu.be/hGQtnxsr1L4>

The connection of **Raspberry Pi T extension board** is as below. **Don't reverse the ribbon.**

If you have a fan, you can connect it to 5V GND of breadboard via jumper wires.

### How to distinguish resistors?

There are only three kind of resistors in this kit.

The one with 1 red ring is  $10\text{K}\Omega$

The one with 2 red rings is  $220\Omega$

The one with 0 red ring is  $1\text{K}\Omega$

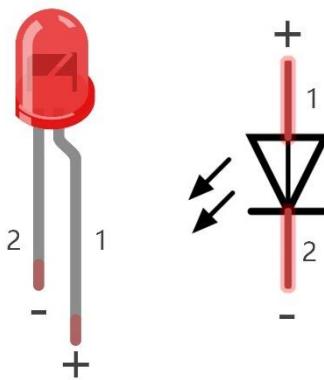

Future hardware connection diagrams will only show that part of breadboard and GPIO Extension Shield.

## Component knowledge

### LED

An LED is a type of diode. All diodes only work if current is flowing in the correct direction and have two Poles. An LED will only work (light up) if the longer pin (+) of LED is connected to the positive output from a power source and the shorter pin is connected to the negative (-) output, which is also referred to as Ground (GND). This type of component is known as "Polar" (think One-Way Street).

All common 2 lead diodes are the same in this respect. Diodes work only if the voltage of its positive electrode is higher than its negative electrode and there is a narrow range of operating voltage for most all common diodes of 1.9 and 3.4V. If you use much more than 3.3V the LED will be damaged and burnt out.

LED	Voltage	Maximum current	Recommended current
Red	1.9-2.2V	20mA	10mA
Green	2.9-3.4V	10mA	5mA
Blue	2.9-3.4V	10mA	5mA

Volt ampere characteristics conform to diode

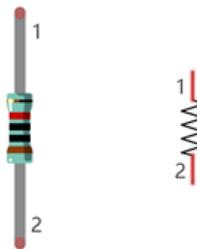

Note: LEDs cannot be directly connected to a power supply, which usually ends in a damaged component. A resistor with a specified resistance value must be connected in series to the LED you plan to use.

### Resistor

Resistors use Ohms ( $\Omega$ ) as the unit of measurement of their resistance ( $R$ ).  $1M\Omega=1000k\Omega$ ,  $1k\Omega=1000\Omega$ .

A resistor is a passive electrical component that limits or regulates the flow of current in an electronic circuit.

On the left, we see a physical representation of a resistor, and the right is the symbol used to represent the presence of a resistor in a circuit diagram or schematic.

The bands of color on a resistor is a shorthand code used to identify its resistance value. For more details of resistor color codes, please refer to the card in the kit package.

With a fixed voltage, there will be less current output with greater resistance added to the circuit. The relationship between Current, Voltage and Resistance can be expressed by this formula:  $I=V/R$  known as Ohm's Law where  $I$  = Current,  $V$  = Voltage and  $R$  = Resistance. Knowing the values of any two of these allows you to solve the value of the third.

In the following diagram, the current through R1 is:  $I=U/R=5V/10k\Omega=0.0005A=0.5mA$ .

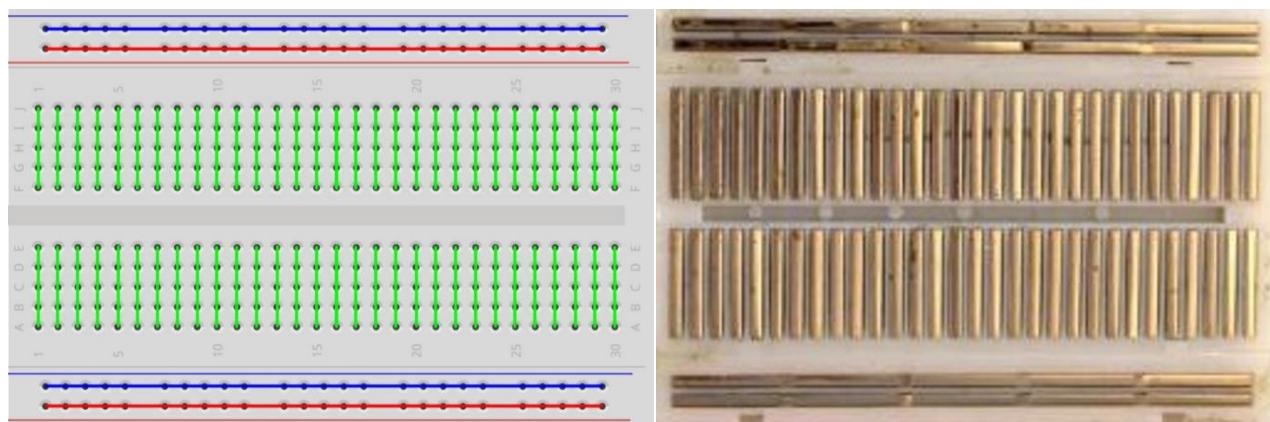

**WARNING:** Never connect the two poles of a power supply with anything of low resistance value (i.e. a metal object or bare wire) this is a Short and results in high current that may damage the power supply and electronic components.

Note: Unlike LEDs and Diodes, Resistors have no poles and are non-polar (it does not matter which direction you insert them into a circuit, it will work the same)

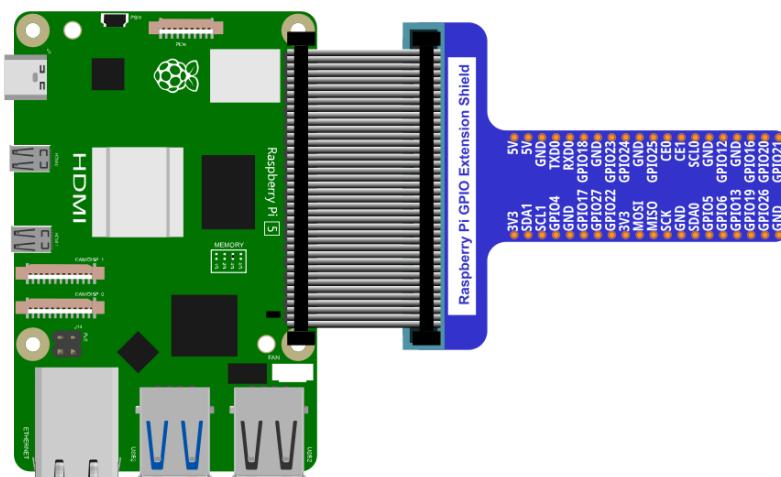

### Breadboard

Here we have a small breadboard as an example of how the rows of holes (sockets) are electrically attached. The left picture shows the ways the pins have shared electrical connection and the right picture shows the actual internal metal, which connect these rows electrically.

### GPIO Extension Board

GPIO board is a convenient way to connect the RPi I/O ports to the breadboard directly. The GPIO pin sequence on Extension Board is identical to the GPIO pin sequence of RPi.

## Code

According to the circuit, when the GPIO17 of RPi output level is high, the LED turns ON. Conversely, when the GPIO17 RPi output level is low, the LED turns OFF. Therefore, we can let GPIO17 cycle output high and output low level to make the LED blink. We will use both C code to achieve the target.

### C Code 1.1.1 Blink

First, enter this command into the Terminal one line at a time. Then observe the results it brings on your project, and learn about the code in detail.

If you want to execute it with editor, please refer to section [Code Editor](#) to configure.

**If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)**

It is recommended that to execute the code via command line.

1. If you did not update wiring pi, please execute following commands **one by one**.

```
sudo apt-get update
```

```
git clone https://github.com/WiringPi/WiringPi
```

```
cd WiringPi
```

```
./build
```

2. Use cd command to enter 01.1.1\_Blink directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/01.1.1_Blink
```

3. Use the following command to compile the code "Blink.c" and generate executable file "Blink".

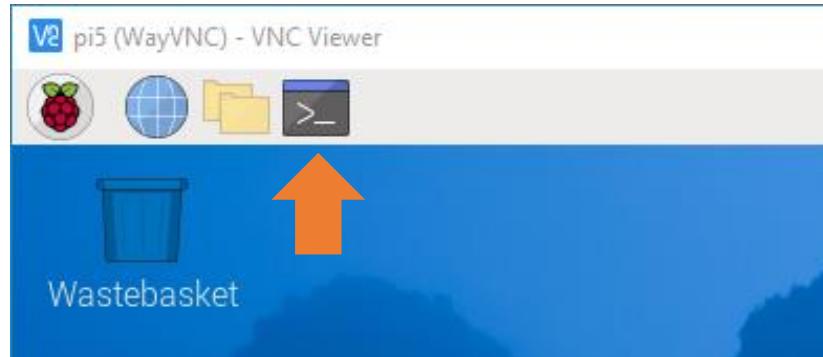

**"I" of "lwiringPi" is low case of "L".**

```
gcc Blink.c -o Blink -lwiringPi
```

4. Then run the generated file "blink".

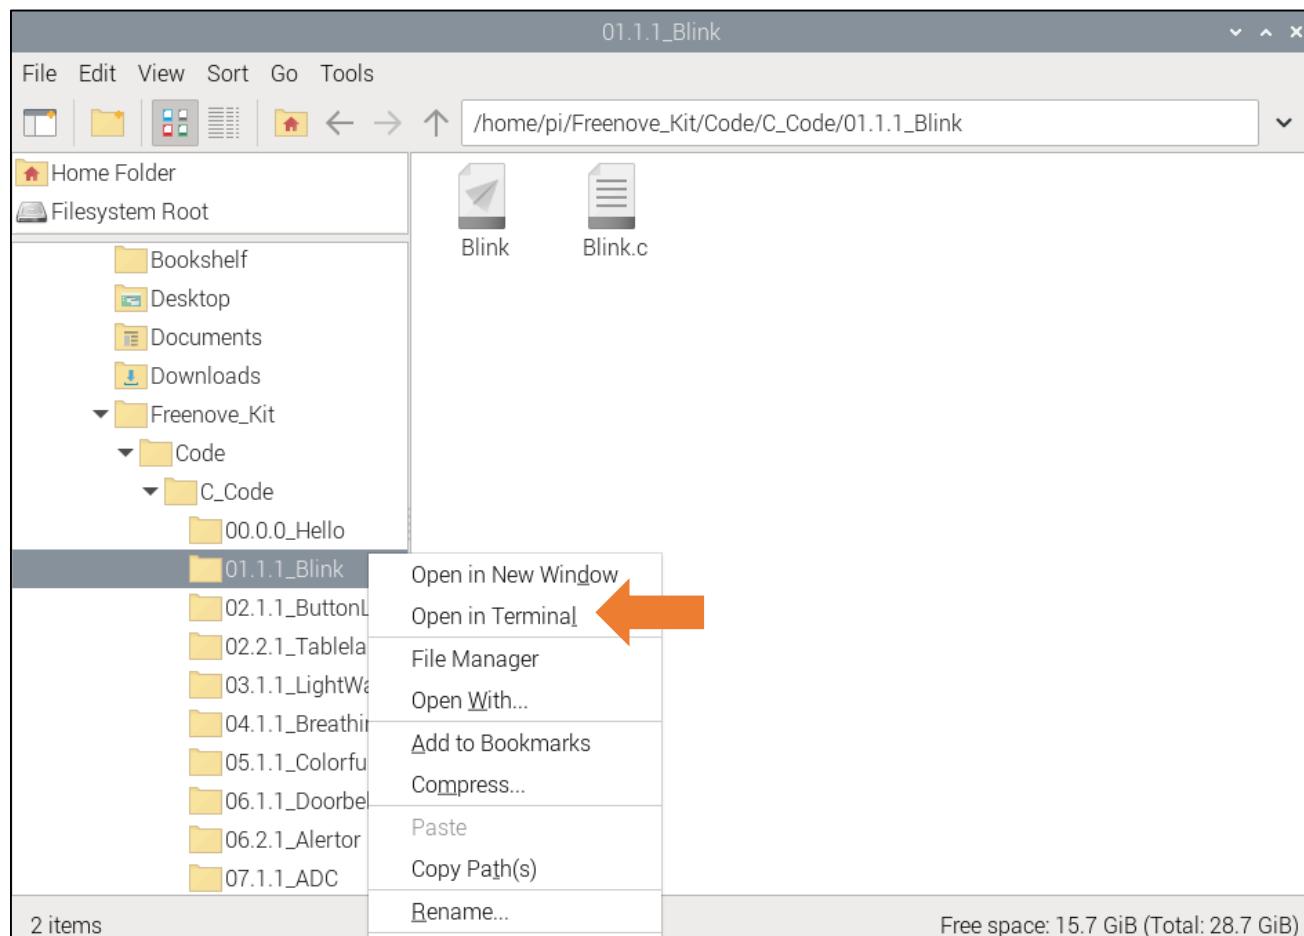

```
sudo ./Blink
```

Now your LED should start blinking! CONGRATUALTIONS! You have successfully completed your first RPi circuit!

```
pi@raspberrypi: ~/Freenove_Kit/Code/C_Code/01.1.1_Blink
File Edit Tabs Help
pi@raspberrypi:~ $ cd Freenove_Kit/Code/C_Code/01.1.1_Blink/
pi@raspberrypi:~/Freenove_Kit/Code/C_Code/01.1.1_Blink $ gcc Blink.c -o Blink -lwiringPi
pi@raspberrypi:~/Freenove_Kit/Code/C_Code/01.1.1_Blink $ ./Blink
```

You can also use the file browser. On the left of folder tree, right-click the folder you want to enter, and click "Open in Terminal".

You can press "Ctrl+C" to end the program. The following is the program code:

```

1 #include <wiringPi.h>
2 #include <stdio.h>
3
4 #define ledPin 0 //define the led pin number
5
6 void main(void)
7 {
8     printf("Program is starting ... \n");
9
10    wiringPiSetup(); //Initialize wiringPi.
11
12    pinMode(ledPin, OUTPUT); //Set the pin mode
13    printf("Using pin%d\n", ledPin); //Output information on terminal
14    while(1)
15    {
16        digitalWrite(ledPin, HIGH); //Make GPIO output HIGH level
17        printf("led turned on >>>\n"); //Output information on terminal
18        delay(1000); //Wait for 1 second
19    }
20}
```

```

18     digitalWrite(ledPin, LOW);      //Make GPIO output LOW level
19     printf("led turned off <<<\n"); //Output information on terminal
20     delay(1000);                  //Wait for 1 second
21 }
22 }
```

In the code above, the configuration function for GPIO is shown below as:

**void pinMode(int pin, int mode);**

This sets the mode of a pin to either INPUT, OUTPUT, PWM\_OUTPUT or GPIO\_CLOCK. Note that only wiringPi pin 1 (BCM\_GPIO 18) supports PWM output and only wiringPi pin 7 (BCM\_GPIO 4) supports CLOCK output modes.

This function has no effect when in Sys mode. If you need to change the pin mode, then you can do it with the gpio program in a script before you start your program

**void digitalWrite (int pin, int value);**

Writes the value HIGH or LOW (1 or 0) to the given pin, which must have been previously set as an output.

For more related wiringpi functions, please refer to <http://wiringpi.com/reference/>

GPIO connected to ledPin in the circuit is GPIO17 and GPIO17 is defined as 0 in the wiringPi numbering. So ledPin should be defined as 0 pin. You can refer to the corresponding table in Chapter 0.

#define ledPin 0 //define the led pin number

GPIO Numbering Relationship

WingPi	BCM(Extension)	Physical		BCM(Extension)	WingPi
3.3V	<b>3.3V</b>	1	2	5V	5V
8	GPIO2/SDA1	3	4	<b>5V</b>	5V
9	GPIO3/SCL1	5	6	<b>GND</b>	GND
7	GPIO4	7	8	GPIO14/TXDO	15
<b>GND</b>	<b>GND</b>	9	10	GPIO15/RXDO	16
0	GPIO17	11	12	GPIO18	1
2	GPIO27	13	14	<b>GND</b>	<b>GND</b>
3	GPIO22	15	16	GPIO23	4
<b>3.3V</b>	<b>3.3V</b>	17	18	GPIO24	5
12	GPIO10/MOSI	19	20	<b>GND</b>	<b>GND</b>
13	GPIO9/MOIS	21	22	GPIO25	6
14	GPIO11/SCLK	23	24	GPIO8/CE0	10
<b>GND</b>	<b>GND</b>	25	26	GPIO7/CE1	11
30	GPIO0/SDAO	27	28	GPIO1/SCL0	31
21	GPIO5	29	30	<b>GND</b>	<b>GND</b>
22	GPIO6	31	32	GPIO12	26
23	GPIO13	33	34	<b>GND</b>	<b>GND</b>
24	GPIO19	35	36	GPIO16	27
25	GPIO26	37	38	GPIO20	28
<b>GND</b>	<b>GND</b>	39	40	GPIO21	29

In the main function main(), initialize wiringPi first.

```
wiringPiSetup() ; //Initialize wiringPi.
```

After the wiringPi is initialized successfully, you can set the ledPin to output mode and then enter the while loop, which is an endless loop (a while loop). That is, the program will always be executed in this cycle, unless it is ended because of external factors. In this loop, use digitalWrite (ledPin, HIGH) to make ledPin output high level, then LED turns ON. After a period of time delay, use digitalWrite(ledPin, LOW) to make ledPin output low level, then LED turns OFF, which is followed by a delay. Repeat the loop, then LED will start blinking.

```
pinMode(ledPin, OUTPUT); //Set the pin mode
printf("Using pin%d\n", %ledPin); //Output information on terminal
while(1) {
    digitalWrite(ledPin, HIGH); //Make GPIO output HIGH level
    printf("led turned on >>>\n"); //Output information on terminal
    delay(1000); //Wait for 1 second
    digitalWrite(ledPin, LOW); //Make GPIO output LOW level
    printf("led turned off <<<\n"); //Output information on terminal
    delay(1000); //Wait for 1 second
}
```

## Other Code Editors (Optional)

If you want to use other editor to edit and execute the code, you can learn them in this section.

### nano

Use the nano editor to open the file "Hello.c", then press " Ctrl+X " to exit.

```
nano Hello.c
```

As is shown below:

The screenshot shows the nano text editor window on a Raspberry Pi. The title bar says "pi@raspberrypi: ~". The menu bar includes "File", "Edit", "Tabs", and "Help". The status bar at the bottom shows keyboard shortcuts for Help (~G), Exit (~X), Write Out (~O), Read File (~R), Where Is (~W), Replace (~\), Cut (~K), Paste (~U), Execute (~T), and Justify (~J). The main editor area contains the following C code:

```
#include <stdio.h>

int main(){
    printf("hello, world!\n");
    return 1;
}
```

Use the following command to compile the code to generate the executable file "Hello".

```
gcc Hello.c -o Hello
```

Use the following command to run the executable file "Hello".

```
sudo ./Hello
```

After the execution, "Hello, World!" is printed out in terminal.

The screenshot shows a terminal window on a Raspberry Pi. The title bar says "pi@raspberrypi: ~". The command "gcc Hello.c -o Hello" is highlighted with a red box. The terminal output shows the following steps:

```
pi@raspberrypi:~ $ nano Hello.c
pi@raspberrypi:~ $ gcc Hello.c -o Hello
pi@raspberrypi:~ $ ls
Bookshelf  Downloads  Hello.c  Public      WiringPi
Desktop    Freenove_Kit  Music   Templates
Documents  Hello      Pictures  Videos
pi@raspberrypi:~ $ ./Hello
hello, world!
pi@raspberrypi:~ $
```

## geany

Next, learn to use the Geany editor. Use the following command to open the Geany in the sample file "Hello.c" file directory path.

**geany Hello.c**

Or find and open Geany directly in the desktop main menu, and then click **File→Open** to open the "Hello.c", Or drag "Hello.c" to Geany directly.

If you want to create a new code, click **File→New→File→Save as (name.c or name.py)**. Then write the code.

Generate an executable file by clicking menu bar Build->Build.

Then execute the generated file by clicking menu bar Build->Execute.

After the execution, a new terminal window will output the characters "Hello, World!", as shown below:

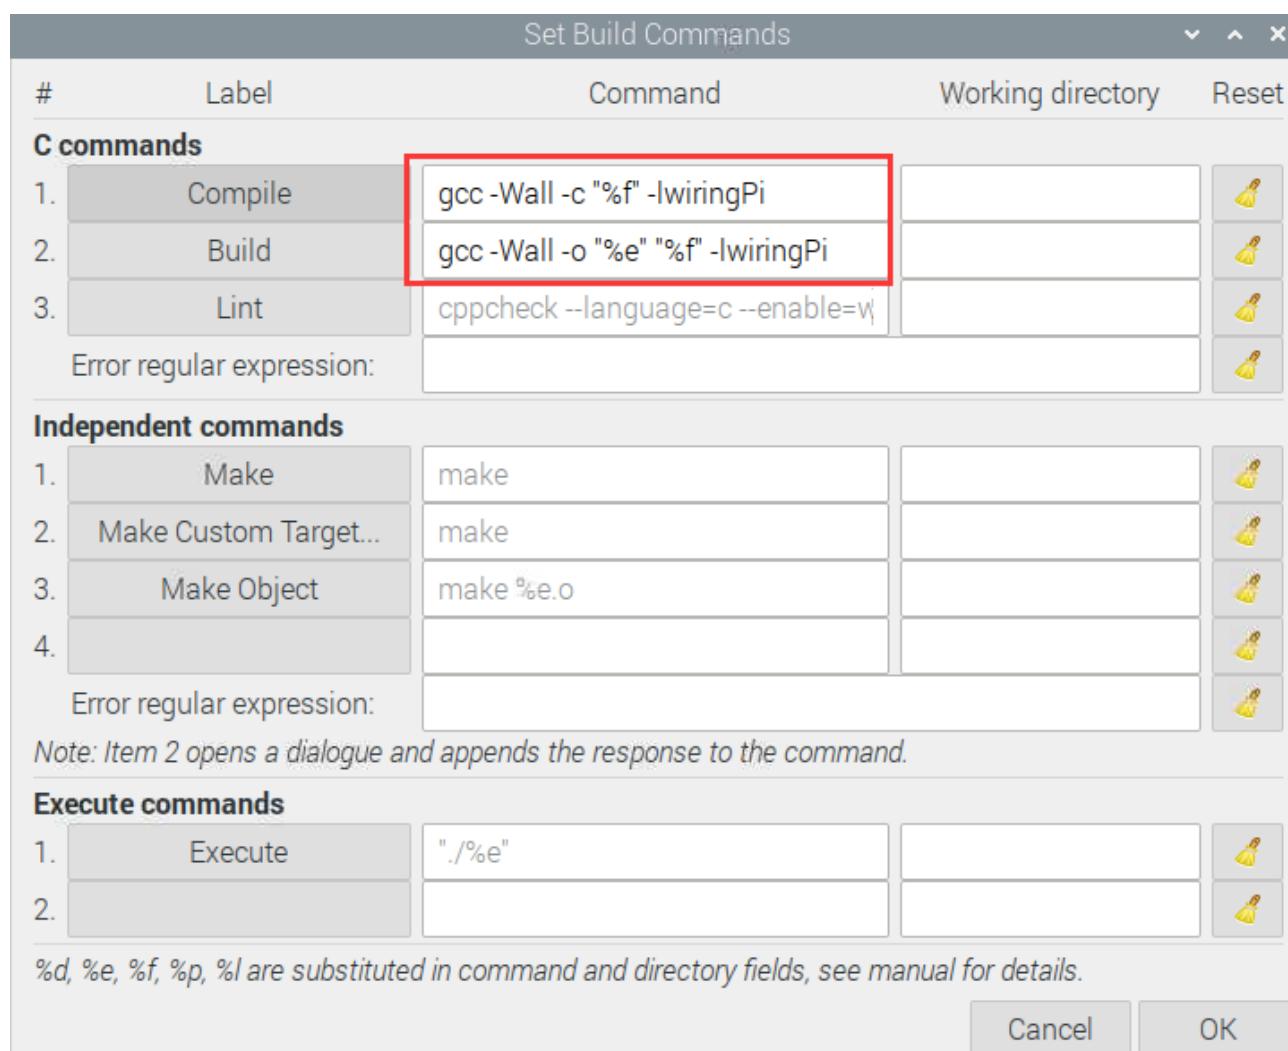

```
geany_run_script_T6FZ02.sh
File Edit Tabs Help

SSH is enabled and the default password for the 'pi' user has not been changed.
This is a security risk - please login as the 'pi' user and type 'passwd' to set
a new password.

hello, world!

-----
(program exited with code: 1)
Press return to continue
```

You can click Build->Set Build Commands to set compiler commands. In later projects, we will use various compiler command options. **If you choose to use Geany, you will need change the compiler command here.** As is shown below:

Here we have identified three code editors: vi, nano and Geany. There are also many other good code editors available to you, and you can choose whichever you prefer to use.

In later projects, we will only use terminal to execute the project code. This way will not modify the code by mistake.

## Freenove Car, Robot and other products for Raspberry Pi

We also have car and robot kits for Raspberry Pi. You can visit our website for details.

## Chapter 2 Buttons & LEDs

Usually, there are three essential parts in a complete automatic control device: INPUT, OUTPUT, and CONTROL. In last section, the LED module was the output part and RPI was the control part. In practical applications, we not only make LEDs flash, but also make a device sense the surrounding environment, receive instructions and then take the appropriate action such as turn on LEDs, make a buzzer beep and so on.

Next, we will build a simple control system to control an LED through a push button switch.

### Project 2.1 Push Button Switch & LED

In the project, we will control the LED state through a Push Button Switch. When the button is pressed, our LED will turn ON, and when it is released, the LED will turn OFF. This describes a Momentary Switch.

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Extension Board & Wire x1 Breadboard x1	LED x1	Resistor 220Ω x1	Resistor 10kΩ x2	Push Button Switch x1
Jumper Wire				

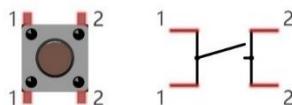

Please Note: In the code “button” represents switch action.

## Component knowledge

### Push Button Switch

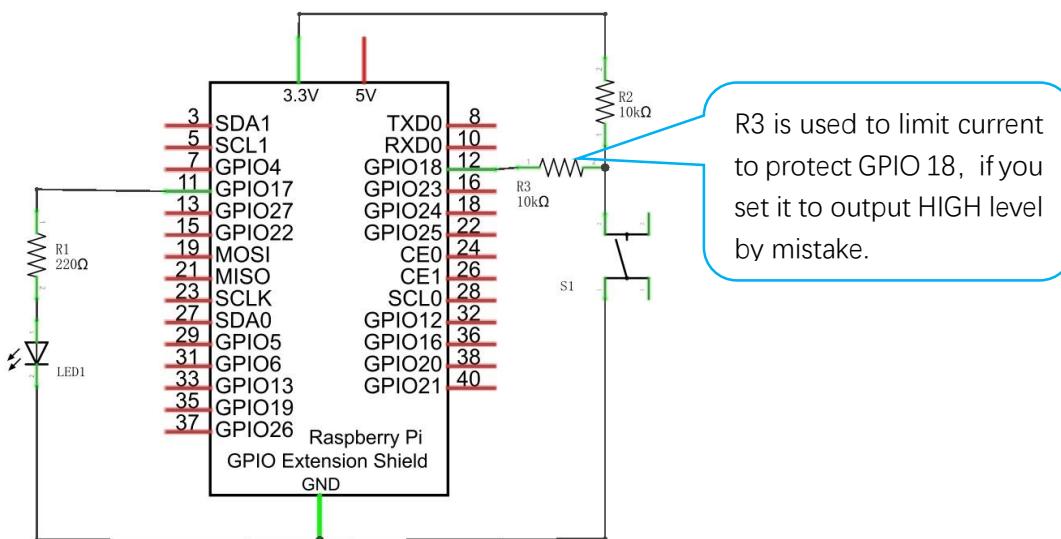

This type of Push Button Switch has 4 pins (2 Pole Switch). Two pins on the left are connected, and both left and right sides are the same per the illustration:

When the button on the switch is pressed, the circuit is completed (your project is Powered ON).

## Circuit

Schematic diagram

Hardware connection. If you need any support, please free to contact us via:[support@freenove.com](mailto:support@freenove.com)

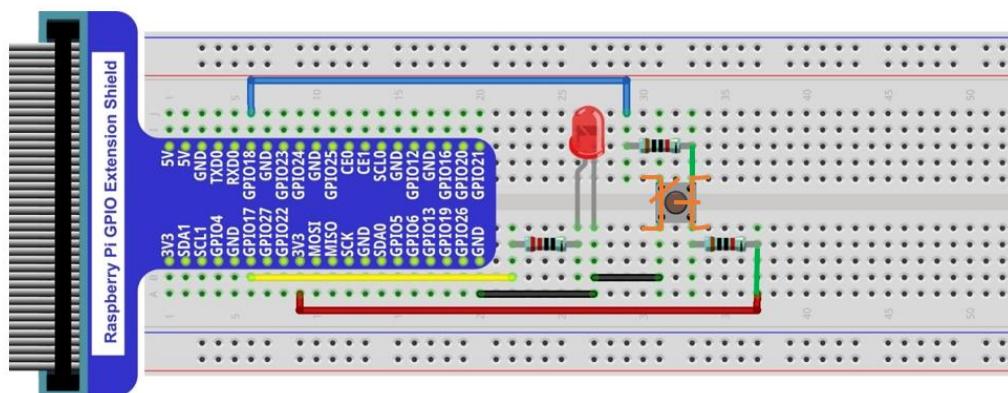

There are two kinds of push button switch in this kit.

**The smaller push button switches are contained in a plastic bag.**

**Youtube video:** [https://youtu.be/\\_5ge1d6f1nM](https://youtu.be/_5ge1d6f1nM)

This is how it works.

When button switch is released:

When button switch is pressed:

## Code

This project is designed for learning how to use Push Button Switch to control an LED. We first need to read the state of switch, and then determine whether to turn the LED ON in accordance to the state of the switch.

### C Code 2.1.1 ButtonLED

First, observe the project result, then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter 02.1.1\_ButtonLED directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/02.1.1_ButtonLED
```

2. Use the following command to compile the code "ButtonLED.c" and generate executable file "ButtonLED"

```
gcc ButtonLED.c -o ButtonLED -lwiringPi
```

3. Then run the generated file "ButtonLED".

```
sudo ./ButtonLED
```

Later, the terminal window continues to print out the characters "led off...". Press the button, then LED is turned on and then terminal window prints out the "led on...". Release the button, then LED is turned off and then terminal window prints out the "led off...". You can press "Ctrl+C" to terminate the program.

The following is the program code:

```
1 #include <wiringPi.h>
```

```

2 #include <stdio.h>
3
4 #define ledPin    0 //define the ledPin
5 #define buttonPin 1 //define the buttonPin
6
7 void main(void)
8 {
9     printf("Program is starting ... \n");
10
11     wiringPiSetup(); //Initialize wiringPi.
12
13     pinMode(ledPin, OUTPUT); //Set ledPin to output
14     pinMode(buttonPin, INPUT); //Set buttonPin to input
15
16     pullUpDnControl(buttonPin, PUD_UP); //pull up to HIGH level
17     while(1) {
18         if(digitalRead(buttonPin) == LOW){ //button is pressed
19             digitalWrite(ledPin, HIGH); //Make GPIO output HIGH level
20             printf("Button is pressed, led turned on >>>\n"); //Output information on
21             terminal
22         }
23         else { //button is released
24             digitalWrite(ledPin, LOW); //Make GPIO output LOW level
25             printf("Button is released, led turned off <<<\n"); //Output information on
26             terminal
27         }
28     }
29 }
```

In the circuit connection, LED and Button are connected with GPIO17 and GPIO18 respectively, which correspond to 0 and 1 respectively in wiringPi. So define ledPin and buttonPin as 0 and 1 respectively.

```
#define ledPin    0 //define the ledPin
#define buttonPin 1 //define the buttonPin
```

In the while loop of main function, use digitalRead(buttonPin) to determine the state of Button. When the button is pressed, the function returns low level, the result of "if" is true, and then turn on LED. Or, turn off LED.

```

if(digitalRead(buttonPin) == LOW){ //button has pressed down
    digitalWrite(ledPin, HIGH); //led on
    printf("led on... \n");
}
else { //button has released
    digitalWrite(ledPin, LOW); //led off
    printf("... led off\n");
}
```

Reference:

```
int digitalRead (int pin);
```

This function returns the value read at the given pin. It will be “**HIGH**” or “**LOW**”(1 or 0) depending on the logic level at the pin.

## Project 2.2 MINI Table Lamp

We will also use a Push Button Switch, LED and RPi to make a MINI Table Lamp but this will function differently: Press the button, the LED will turn ON, and pressing the button again, the LED turns OFF. The ON switch action is no longer momentary (like a door bell) but remains ON without needing to continually press on the Button Switch.

First, let us learn something about the push button switch.

### Debounce a Push Button Switch

When a Momentary Push Button Switch is pressed, it will not change from one state to another state immediately. Due to tiny mechanical vibrations, there will be a short period of continuous buffeting before it stabilizes in a new state too fast for Humans to detect but not for computer microcontrollers. The same is true when the push button switch is released. This unwanted phenomenon is known as “bounce”.

Therefore, if we can directly detect the state of the Push Button Switch, there are multiple pressing and releasing actions in one pressing cycle. This buffeting will mislead the high-speed operation of the microcontroller to cause many false decisions. Therefore, we need to eliminate the impact of buffeting. Our solution: to judge the state of the button multiple times. Only when the button state is stable (consistent) over a period of time, can it indicate that the button is actually in the ON state (being pressed).

This project needs the same components and circuits as we used in the previous section.

## Code

In this project, we still detect the state of Push Button Switch to control an LED. Here we need to define a variable to define the state of LED. When the button switch is pressed once, the state of LED will be changed once. This will allow the circuit to act as a virtual table lamp.

### C Code 2.2.1 Tablelamp

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: support@freenove.com

1. Use cd command to enter 02.2.1\_Tablelamp directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/02.2.1_Tablelamp
```

2. Use the following command to compile "Tablelamp.c" and generate executable file "Tablelamp".

```
gcc Tablelamp.c -o Tablelamp -lwiringPi
```

3. Tablelamp: Then run the generated file "Tablelamp".

```
sudo ./Tablelamp
```

When the program is executed, press the Button Switch once, the LED turns ON. Pressing the Button Switch again turns the LED OFF.

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3
4 #define ledPin    0 //define the ledPin
5 #define buttonPin 1 //define the buttonPin
6 int ledState=LOW; //store the State of led
7 int buttonState=HIGH; //store the State of button
8 int lastbuttonState=HIGH;//store the lastState of button
9 long lastChangeTime; //store the change time of button state
10 long captureTime=50; //set the stable time for button state
11 int reading;
12 int main(void)
13 {
14     printf("Program is starting...\n");
15
16     wiringPiSetup(); //Initialize wiringPi.
17
18     pinMode(ledPin, OUTPUT); //Set ledPin to output
19     pinMode(buttonPin, INPUT); //Set buttonPin to input
20
21     pullUpDnControl(buttonPin, PUD_UP); //pull up to high level
22     while(1) {
23         reading = digitalRead(buttonPin); //read the current state of button
24         if( reading != lastbuttonState){ //if the button state has changed, record the time
25             point
26             lastChangeTime = millis();
27         }
28     }
29 }
```

```

27     //if changing-state of the button last beyond the time we set, we consider that
28     //the current button state is an effective change rather than a buffeting
29     if(millis() - lastChangeTime > captureTime){
30         //if button state is changed, update the data.
31         if(reading != buttonState){
32             buttonState = reading;
33             //if the state is low, it means the action is pressing
34             if(buttonState == LOW){
35                 printf("Button is pressed!\n");
36                 ledState = !ledState; //Reverse the LED state
37                 if(ledState){
38                     printf("turn on LED ... \n");
39                 }
40                 else {
41                     printf("turn off LED ... \n");
42                 }
43             }
44             //if the state is high, it means the action is releasing
45             else {
46                 printf("Button is released!\n");
47             }
48         }
49     }
50     digitalWrite(ledPin, ledState);
51     lastbuttonState = reading;
52 }
53
54     return 0;
55 }
```

This code focuses on eliminating the buffeting (bounce) of the button switch. We define several variables to define the state of LED and button switch. Then read the button switch state constantly in while () to determine whether the state has changed. If it has, then this time point is recorded.

```

reading = digitalRead(buttonPin); //read the current state of button
if( reading != lastbuttonState){
    lastChangeTime = millis();
}
```

### millis()

This returns a number representing the number of milliseconds since your program called one of the wiringPiSetup functions. It returns to an unsigned 32-bit number value after 49 days because it “wraps” around and restarts to value 0.

Then according to the recorded time point, evaluate the duration of the button switch state change. If the duration exceeds captureTime (buffeting time) we have set, it indicates that the state of the button switch has changed. During that time, the while () is still detecting the state of the button switch, so if there is a change, the time point of change will be updated. Then the duration will be evaluated again until the duration is determined to be a stable state because it exceeds the time value we set.

```
if(millis() - lastChangeTime > captureTime) {  
    //if button state is changed, update the data.  
    if(reading != buttonState) {  
        buttonState = reading;
```

Finally, we need to judge the state of Button Switch. If it is low level, the changing state indicates that the button Switch has been pressed, if the state is high level, then the button has been released. Here, we change the status of the LED variable, and then update the state of the LED.

```
if(buttonState == LOW) {  
    printf("Button is pressed!\n");  
    ledState = !ledState; //Reverse the LED state  
    if(ledState){  
        printf("turn on LED ... \n");  
    }  
    else {  
        printf("turn off LED ... \n");  
    }  
}  
//if the state is high, it means the action is releasing  
else {  
    printf("Button is released!\n");  
}
```

# Chapter 3 LED Bar Graph

We have learned how to control one LED to blink. Next, we will learn how to control a number of LEDs.

## Project 3.1 Flowing Water Light

In this project, we use a number of LEDs to make a flowing water light.

### Component List

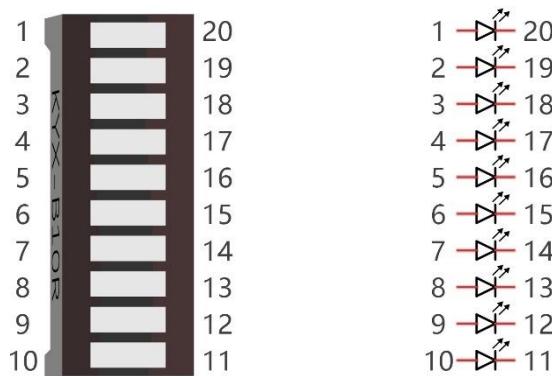

Raspberry Pi (with 40 GPIO) x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Bar Graph LED x1	Resistor 220Ω x10
Jumper Wire x 1		

### Component knowledge

Let us learn about the basic features of these components to use and understand them better.

#### Bar Graph LED

A Bar Graph LED has 10 LEDs integrated into one compact component. The two rows of pins at its bottom are paired to identify each LED like the single LED used earlier.

## Circuit

A reference system of labels is used in the circuit diagram below. Pins with the same network label are connected together.

Schematic diagram

Hardware connection. If you need any support, please free to contact us via: [support@freenove.com](mailto:support@freenove.com)

Youtube video: <https://youtu.be/3rh-b05VoiU>

In this circuit, the cathodes of the LEDs are connected to the GPIO, which is different from the previous circuit. The LEDs turn ON when the GPIO output is low level in the program.

## Code

This project is designed to make a flowing water lamp, which are these actions: First turn LED #1 ON, then

turn it OFF. Then turn LED #2 ON, and then turn it OFF... and repeat the same to all 10 LEDs until the last LED is turns OFF. This process is repeated to achieve the “movements” of flowing water.

### C Code 3.1.1 LightWater

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 03.1.1\_LightWater directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/03.1.1_LightWater
```

2. Use the following command to compile “LightWater.c” and generate executable file “LightWater”.

```
gcc LightWater.c -o LightWater -lwiringPi
```

3. Then run the generated file “LightWater”.

```
sudo ./LightWater
```

After the program is executed, you will see that Bar Graph LED starts with the flowing water pattern flashing from left to right and then back from right to left.

The following is the program code:

```

1  #include <wiringPi.h>
2  #include <stdio.h>
3
4  #define ledCounts 10
5  int pins[ledCounts] = {0, 1, 2, 3, 4, 5, 6, 8, 9, 10};
6
7  void main(void)
8  {
9      int i;
10     printf("Program is starting ... \n");
11
12     wiringPiSetup(); //Initialize wiringPi.
13
14     for(i=0;i<ledCounts;i++) {      //Set pinMode for all led pins to output
15         pinMode(pins[i], OUTPUT);
16     }
17
18     while(1) {
19         for(i=0;i<ledCounts;i++) {    // move led(on) from left to right
20             digitalWrite(pins[i],LOW);
21             delay(100);
22             digitalWrite(pins[i],HIGH);
23         }
24         for(i=ledCounts-1;i>-1;i--) { // move led(on) from right to left
25             digitalWrite(pins[i],LOW);
26             delay(100);
27             digitalWrite(pins[i],HIGH);
28         }
29     }

```

In the program, configure the GPIO0-GPIO9 to output mode. Then, in the endless “while” loop of main function, use two “for” loop to realize flowing water light from left to right and from right to left.

```
while(1) {  
    for(i=0;i<ledCounts;i++) { // move led(on) from left to right  
        digitalWrite(pins[i],LOW);  
        delay(100);  
        digitalWrite(pins[i],HIGH);  
    }  
    for(i=ledCounts-1;i>-1;i--) { // move led(on) from right to left  
        digitalWrite(pins[i],LOW);  
        delay(100);  
        digitalWrite(pins[i],HIGH);  
    }  
}
```

# Chapter 4 Analog & PWM

In previous chapters, we learned that a Push Button Switch has two states: Pressed (ON) and Released (OFF), and an LED has a Light ON and OFF state. Is there a middle or intermediated state? We will next learn how to create an intermediate output state to achieve a partially bright (dim) LED.

First, let us learn how to control the brightness of an LED.

## Project 4.1 Breathing LED

We describe this project as a Breathing Light. This means that an LED that is OFF will then turn ON gradually and then gradually turn OFF like "breathing". Okay, so how do we control the brightness of an LED to create a Breathing Light? We will use PWM to achieve this goal.

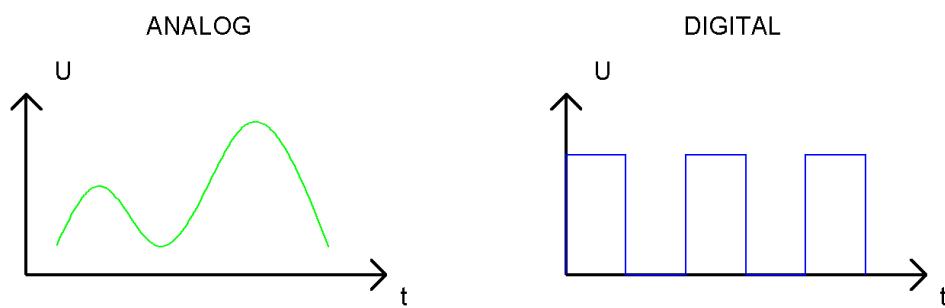

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	LED x1	Resistor 220Ω x1
Jumper Wire 		

### Component Knowledge

#### Analog & Digital

An Analog Signal is a continuous signal in both time and value. On the contrary, a Digital Signal **or** discrete-time signal is a time series consisting of a sequence of quantities. Most signals in life are analog signals. A familiar example of an Analog Signal would be how the temperature throughout the day is continuously changing and could not suddenly change instantaneously from 0°C to 10°C. However, Digital Signals can instantaneously change in value. This change is expressed in numbers as 1 and 0 (the basis of binary code). Their differences can more easily be seen when compared when graphed as below.

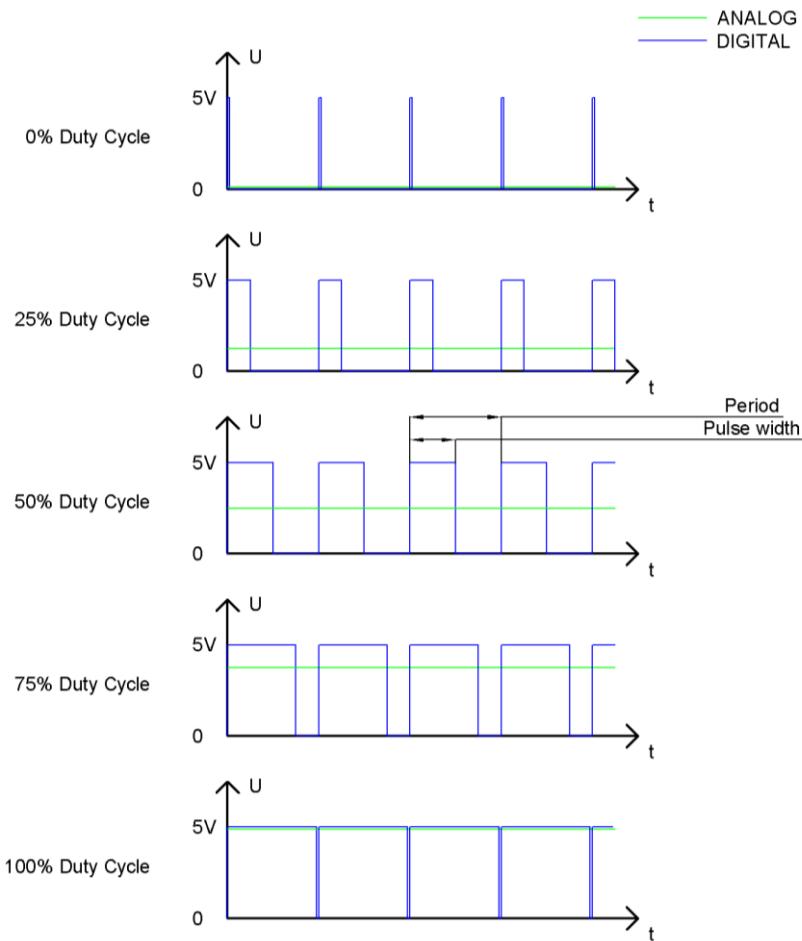

Note that the Analog signals are curved waves and the Digital signals are "Square Waves".

In practical applications, we often use binary as the digital signal, that is a series of 0's and 1's. Since a binary signal only has two values (0 or 1) it has great stability and reliability. Lastly, both analog and digital signals can be converted into the other.

### PWM

PWM, Pulse-Width Modulation, is a very effective method for using digital signals to control analog circuits. Digital processors cannot directly output analog signals. PWM technology makes it very convenient to achieve this conversion (translation of digital to analog signals).

PWM technology uses digital pins to send certain frequencies of square waves, that is, the output of high levels and low levels, which alternately last for a while. The total time for each set of high levels and low levels is generally fixed, which is called the period (Note: the reciprocal of the period is frequency). The time of high level outputs are generally called "pulse width", and the duty cycle is the percentage of the ratio of pulse duration, or pulse width (PW) to the total period (T) of the waveform. The longer the output of high levels last, the longer the duty cycle and the higher the corresponding voltage in the analog signal will be. The following figures show how the analog signal voltages vary between 0V-5V (high level is 5V) corresponding to the pulse width 0%-100%:

The longer the PWM duty cycle is, the higher the output power will be. Now that we understand this relationship, we can use PWM to control the brightness of an LED or the speed of DC motor and so on.

It is evident, from the above, that PWM is not actually analog but the effective value of voltage is equivalent to the corresponding analog value. Therefore, by using PWM, we can control the output power of to an LED and control other devices and modules to achieve multiple effects and actions.

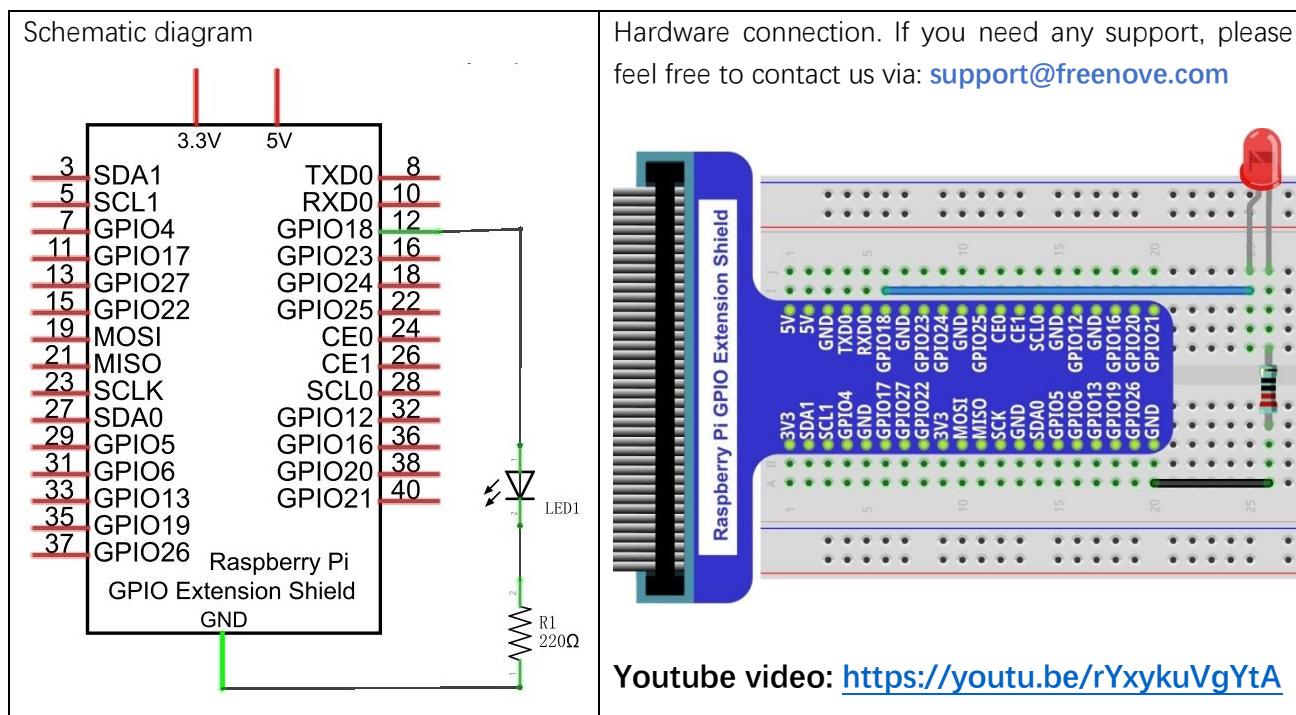

In RPi, GPIO18 pin has the ability to output to hardware via PWM with a 10-bit accuracy. This means that 100% of the pulse width can be divided into  $2^{10}=1024$  equal parts.

The wiringPi library of C provides both a hardware PWM and a software PWM method.

The hardware PWM only needs to be configured, does not require CPU resources and is more precise in time control. The software PWM requires the CPU to work continuously by using code to output high level and low level. This part of the code is carried out by multi-threading, and the accuracy is relatively not high enough.

In order to keep the results running consistently, we will use PWM.

## Circuit

## Code

This project uses the PWM output from the GPIO18 pin to make the pulse width gradually increase from 0% to 100% and then gradually decrease from 100% to 0% to make the LED glow brighter then dimmer.

### C Code 4.1.1 BreathingLED

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter 04.1.1\_BreathingLED directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/04.1.1_BreathingLED
```

2. Use following command to compile "BreathingLED.c" and generate executable file "BreathingLED".

```
gcc BreathingLED.c -o BreathingLED -lwiringPi
```

3. Then run the generated file "BreathingLED"

```
sudo ./BreathingLED
```

After the program is executed, you'll see that LED is turned from on to off and then from off to on gradually like breathing.

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <softPwm.h>
4 #define ledPin    1
5 void main(void)
6 {

```

```

7     int i;
8
9     printf("Program is starting ... \n");
10
11    wiringPiSetup(); //Initialize wiringPi.
12
13    softPwmCreate(ledPin, 0, 100); //Create SoftPWM pin
14
15    while(1) {
16        for(i=0;i<100;i++) { //make the led brighter
17            softPwmWrite(ledPin, i);
18            delay(20);
19        }
20        delay(300);
21        for(i=100;i>=0;i--) { //make the led darker
22            softPwmWrite(ledPin, i);
23            delay(20);
24        }
25        delay(300);
26    }
27 }
```

First, create a software PWM pin.

```
softPwmCreate(ledPin, 0, 100); //Create SoftPWM pin
```

There are two “for” loops in the next endless “while” loop. The first loop outputs a power signal to the ledPin PWM from 0% to 100% and the second loop outputs a power signal to the ledPin PWM from 100% to 0%.

```

while(1) {
    for(i=0;i<100;i++) {
        softPwmWrite(ledPin, i);
        delay(20);
    }
    delay(300);
    for(i=100;i>=0;i--) {
        softPwmWrite(ledPin, i);
        delay(20);
    }
    delay(300);
}
```

You can also adjust the rate of the state change of LED by changing the parameter of the delay() function in the “for” loop.

```
int softPwmCreate (int pin, int initialValue, int pwmRange);
```

This creates a software controlled PWM pin.

```
void softPwmWrite (int pin, int value);
```

This updates the PWM value on the given pin.

For more details, please refer <http://wiringpi.com/reference/software-pwm-library/>

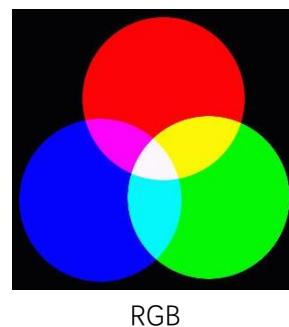

## Chapter 5 RGB LED

In this chapter, we will learn how to control a RGB LED.

An RGB LED has 3 LEDs integrated into one LED component. It can respectively emit Red, Green and Blue light. In order to do this, it requires 4 pins (this is also how you identify it). The long pin (1) is the common which is the Anode (+) or positive lead, the other 3 are the Cathodes (-) or negative leads. A rendering of a RGB LED and its electronic symbol are shown below. We can make RGB LED emit various colors of light and brightness by controlling the 3 Cathodes (2, 3 & 4) of the RGB LED

Red, Green, and Blue light are called 3 Primary Colors when discussing light (Note: for pigments such as paints, the 3 Primary Colors are Red, Blue and Yellow). When you combine these three Primary Colors of light with varied brightness, they can produce almost any color of visible light. Computer screens, single pixels of cell phone screens, neon lamps, etc. can all produce millions of colors due to phenomenon.

If we use a three 8 bit PWM to control the RGB LED, in theory, we can create  $2^8 * 2^8 * 2^8 = 16777216$  (16 million) colors through different combinations of RGB light brightness.

Next, we will use RGB LED to make a multicolored LED.

## Project 5.1 Multicolored LED

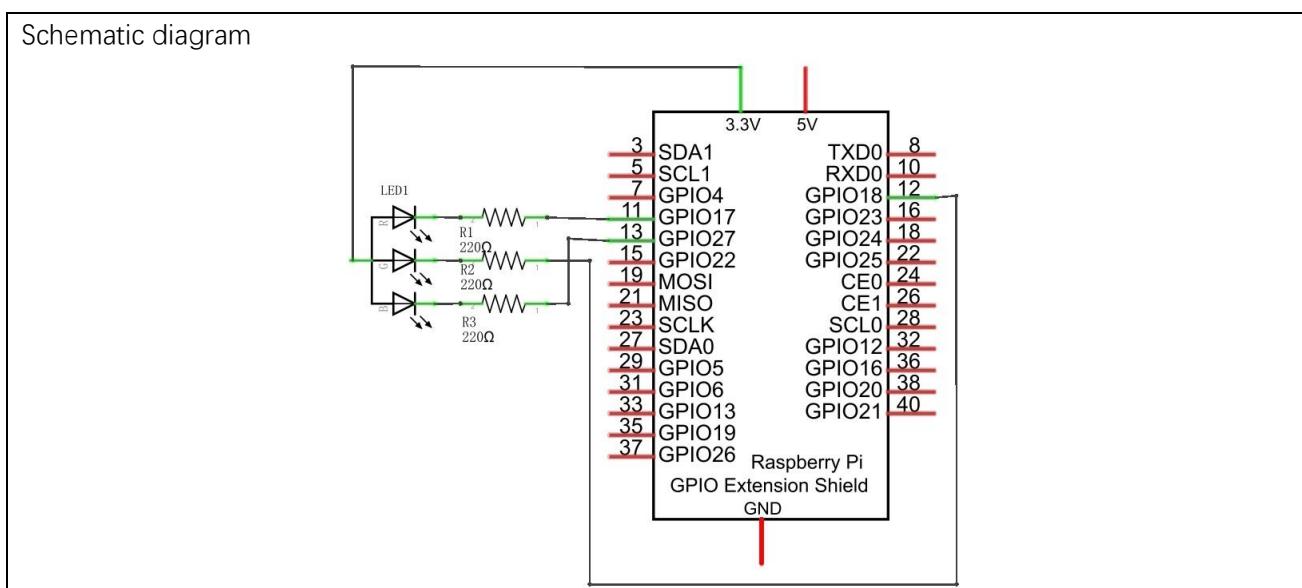

### Component List

Raspberry Pi (with 40 GPIO) x1	RGB LED x1	Resistor 220Ω x3
GPIO Extension Board & Wire x1		
Breadboard x1		

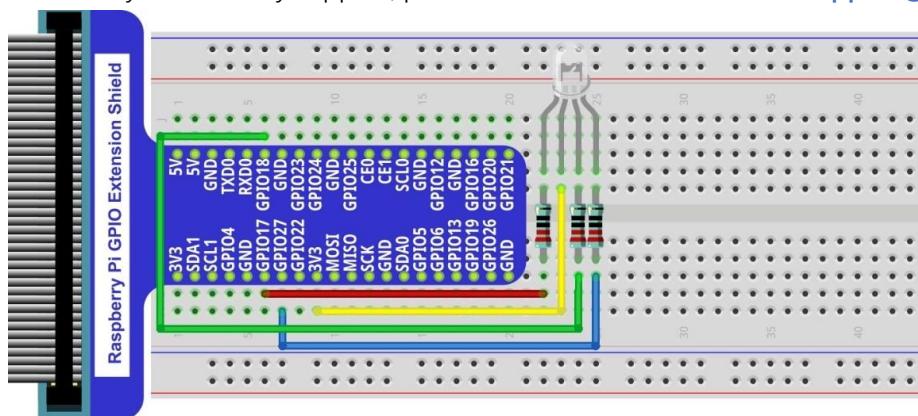

Jumper Wire

### Circuit

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

Video: <https://youtu.be/tbnX2AsX2y4>

In this kit, the RGB led is **Common anode**. The **voltage difference** between LED will make it work. There is

no visible GND. The GPIO ports can also receive current while in output mode.

If circuit above doesn't work, the RGB LED may be common cathode. Please try following wiring.

There is no need to modify code for random color.

## Code

We need to use the software to make the ordinary GPIO output PWM, since this project requires 3 PWM and in RPi only one GPIO has the hardware capability to output PWM,

### C Code 5.1.1 Colorful LED

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: support@freenove.com

1. Use cd command to enter 05.1.1\_ColorfullLED directory of C code.

`cd ~/Freenove_Kit/Code/C_Code/05.1.1_ColorfullLED`

2. Use following command to compile "ColorfullLED.c" and generate executable file "ColorfullLED".

Note: in this project, the software PWM uses a multi-threading mechanism. So "-lpthread" option need to be add to the compiler.

`gcc ColorfullLED.c -o ColorfullLED -lwiringPi -lpthread`

3. And then run the generated file "ColorfullLED".

`sudo ./ColorfullLED`

After the program is executed, you will see that the RGB LED shows lights of different colors randomly.

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <softPwm.h>
3 #include <stdio.h>
4 #include <stdlib.h>
5
6 #define ledPinRed    0
7 #define ledPinGreen   1
8 #define ledPinBlue    2
9
10 void setupLedPin(void)
11 {

```

```

12     softPwmCreate(ledPinRed, 0, 100); //Creat SoftPWM pin for red
13     softPwmCreate(ledPinGreen, 0, 100); //Creat SoftPWM pin for green
14     softPwmCreate(ledPinBlue, 0, 100); //Creat SoftPWM pin for blue
15 }
16
17 void setLedColor(int r, int g, int b)
18 {
19     softPwmWrite(ledPinRed, r); //Set the duty cycle
20     softPwmWrite(ledPinGreen, g); //Set the duty cycle
21     softPwmWrite(ledPinBlue, b); //Set the duty cycle
22 }
23
24 int main(void)
25 {
26     int r,g,b;
27
28     printf("Program is starting ... \n");
29
30     wiringPiSetup(); //Initialize wiringPi.
31
32     setupLedPin();
33     while(1) {
34         r=random()%100; //get a random in (0,100)
35         g=random()%100; //get a random in (0,100)
36         b=random()%100; //get a random in (0,100)
37         setLedColor(r,g,b); //set random as the duty cycle value
38 // If you are using common anode RGBLED, it should be setLedColor(100-r, 100-g, 100-b)
39 // If you want show red, it should be setLedColor(0,100, 100)
40         printf("r=%d, g=%d, b=%d \n",r,g,b);
41         delay(1000);
42     }
43     return 0;
44 }
```

First, in subfunction of ledInit(), create the software PWM control pins used to control the R, G, B pin respectively.

	<pre> void setupLedPin(void) {     softPwmCreate(ledPinRed, 0, 100); //Creat SoftPWM pin for red     softPwmCreate(ledPinGreen, 0, 100); //Creat SoftPWM pin for green     softPwmCreate(ledPinBlue, 0, 100); //Creat SoftPWM pin for blue }</pre>
--	--

Then create subfunction, and set the PWM of three pins.

	<pre>void setLedColor(int r, int g, int b)</pre>
--	--

```
{  
    softPwmWrite(ledPinRed, r); //Set the duty cycle  
    softPwmWrite(ledPinGreen, g); //Set the duty cycle  
    softPwmWrite(ledPinBlue, b); //Set the duty cycle  
}
```

Finally, in the “while” loop of main function, get three random numbers and specify them as the PWM duty cycle, which will be assigned to the corresponding pins. So RGB LED can switch the color randomly all the time.

```
while(1){  
    r=random()%100; //get a random in (0, 100)  
    g=random()%100; //get a random in (0, 100)  
    b=random()%100; //get a random in (0, 100)  
    setLedColor(r, g, b); //set random as the duty cycle value  
    printf("r=%d, g=%d, b=%d \n", r, g, b);  
    delay(1000);  
}
```

The related function of PWM Software can be described as follows:

**long random();**

This function will return a random number.

For more details about Software PWM, please refer to: <http://wiringpi.com/reference/software-pwm-library/>

# Chapter 6 Buzzer

In this chapter, we will learn about buzzers and the sounds they make. And in our next project, we will use an active buzzer to make a doorbell and a passive buzzer to make an alarm.

## Project 6.1 Doorbell

We will make a doorbell with this functionality: when the Push Button Switch is pressed the buzzer sounds and when the button is released, the buzzer stops. This is a momentary switch function.

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Jumper Wire 			
NPN transistor x1 (S8050) 	Active buzzer x1 	Push Button Switch x1 	Resistor 1kΩ x1 	Resistor 10kΩ x2 

## Component knowledge

### Buzzer

A buzzer is an audio component. They are widely used in electronic devices such as calculators, electronic alarm clocks, automobile fault indicators, etc. There are both active and passive types of buzzers. Active buzzers have oscillator inside, these will sound as long as power is supplied. Passive buzzers require an external oscillator signal (generally using PWM with different frequencies) to make a sound.

Active buzzers are easier to use. Generally, they only make a specific sound frequency. Passive buzzers require an external circuit to make sounds, but passive buzzers can be controlled to make sounds of various frequencies. The resonant frequency of the passive buzzer in this Kit is 2kHz, which means the passive buzzer is the loudest when its resonant frequency is 2kHz.

#### How to identify active and passive buzzer?

1. As a rule, there is a label on an active buzzer covering the hole where sound is emitted, but there are exceptions to this rule.
2. Active buzzers are more complex than passive buzzers in their manufacture. There are many circuits and crystal oscillator elements inside active buzzers; all of this is usually protected with a waterproof coating (and a housing) exposing only its pins from the underside. On the other hand, passive buzzers do not have protective coatings on their underside. From the pin holes, view of a passive buzzer, you can see the circuit board, coils, and a permanent magnet (all or any combination of these components depending on the model).

Active buzzer bottom

Passive buzzer bottom

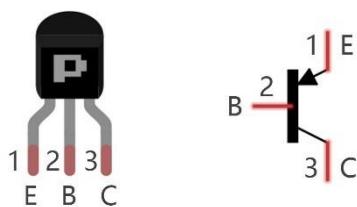

### Transistors

A transistor is required in this project due to the buzzer's current being so great that GPIO of RPi's output capability cannot meet the power requirement necessary for operation. A NPN transistor is needed here to

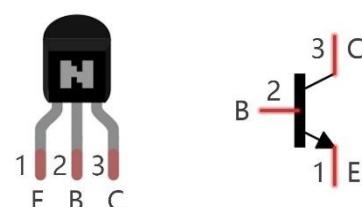

amplify the current.

Transistors, full name: semiconductor transistor, is a semiconductor device that controls current (think of a transistor as an electronic “amplifying or switching device”). Transistors can be used to amplify weak signals, or to work as a switch. Transistors have three electrodes (PINs): base (b), collector (c) and emitter (e). When there is current passing between “be” then “ce” will have a several-fold current increase (transistor magnification), in this configuration the transistor acts as an amplifier. When current produced by “be” exceeds a certain value, “ce” will limit the current output. at this point the transistor is working in its saturation region and acts like a switch. Transistors are available as two types as shown below: PNP and NPN,

PNP transistor

NPN transistor

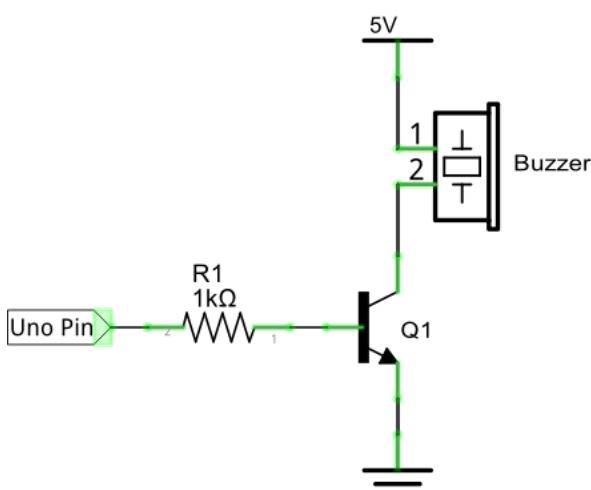

In our kit, the PNP transistor is marked with 8550, and the NPN transistor is marked with 8050.

Thanks to the transistor's characteristics, they are often used as switches in digital circuits. As micro-controllers output current capacity is very weak, we will use a transistor to amplify its current in order to drive components requiring higher current.

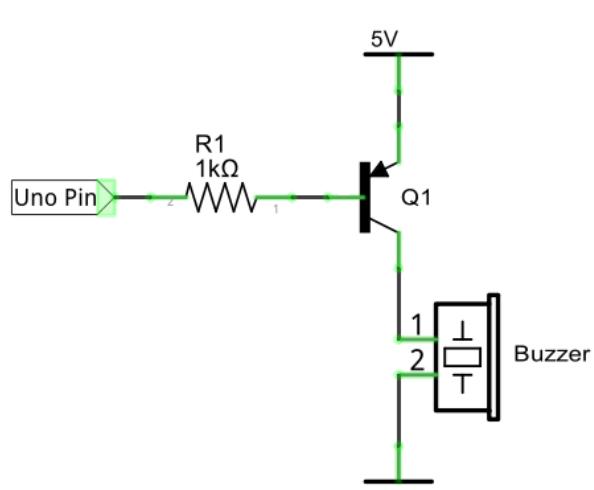

When we use a NPN transistor to drive a buzzer, we often use the following method. If GPIO outputs high level, current will flow through R1 (Resistor 1), the transistor conducts current and the buzzer will make sounds. If GPIO outputs low level, no current will flow through R1, the transistor will not conduct current and buzzer will remain silent (no sounds).

When we use a PNP transistor to drive a buzzer, we often use the following method. If GPIO outputs low level, current will flow through R1. The transistor conducts current and the buzzer will make sounds. If GPIO outputs high level, no current flows through R1, the transistor will not conduct current and buzzer will remain silent (no sounds). Below are the circuit schematics for both a NPN and PNP transistor to power a buzzer.

NPN transistor to drive buzzer

PNP transistor to drive buzzer

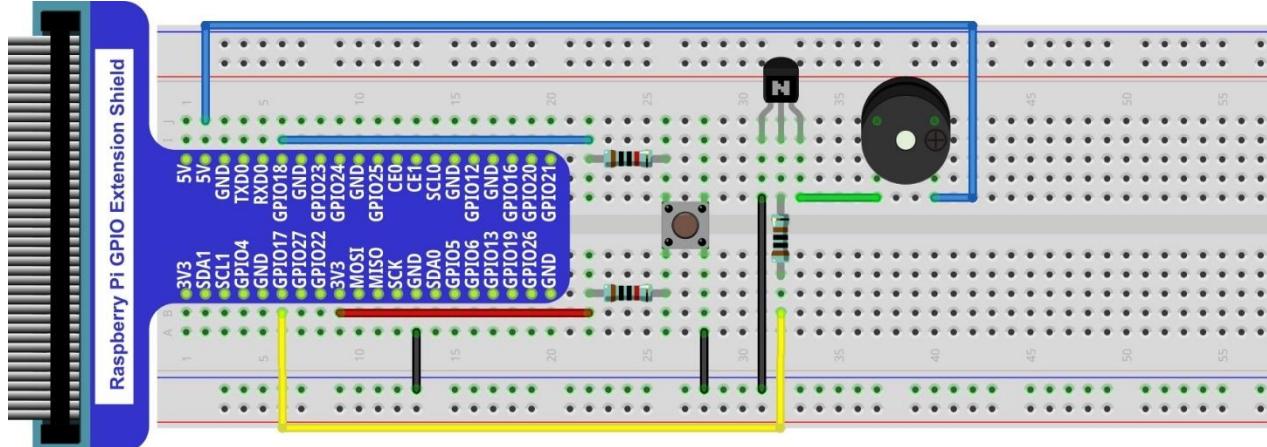

## Circuit

Schematic diagram with RPi GPIO Extension Shield

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

[Video: https://youtu.be/R\\_dmi3YwY-U](https://youtu.be/R_dmi3YwY-U)

Note: in this circuit, the power supply for the buzzer is 5V, and pull-up resistor of the push button switch is connected to the 3.3V power feed. Actually, the buzzer can work when connected to the 3.3V power feed but this will produce a weak sound from the buzzer (not very loud).

## Code

In this project, a buzzer will be controlled by a push button switch. When the button switch is pressed, the buzzer sounds and when the button is released, the buzzer stops. It is analogous to our earlier project that controlled an LED ON and OFF.

### C Code 6.1.1 Doorbell

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: support@freenove.com

1. Use cd command to enter 06.1.1\_Doorbell directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/06.1.1_Doorbell
```

2. Use following command to compile "Doorbell.c" and generate executable file "Doorbell.c".

```
gcc Doorbell.c -o Doorbell -lwiringPi
```

3. Then run the generated file "Doorbell".

```
sudo ./Doorbell
```

After the program is executed, press the push button switch and the will buzzer sound. Release the push button switch and the buzzer will stop.

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3
4 #define buzzerPin 0 //define the buzzerPin
5 #define buttonPin 1 //define the buttonPin
6
7 void main(void)
8 {
9     printf("Program is starting ... \n");
10
11     wiringPiSetup();
12
13     pinMode(buzzerPin, OUTPUT);
14     pinMode(buttonPin, INPUT);
15
16     pullUpDnControl(buttonPin, PUD_UP); //pull up to HIGH level
17     while(1) {
18
19         if(digitalRead(buttonPin) == LOW){ //button is pressed
20             digitalWrite(buzzerPin, HIGH); //Turn on buzzer
21             printf("buzzer turned on >>> \n");
22         }
23         else { //button is released
24             digitalWrite(buzzerPin, LOW); //Turn off buzzer
25             printf("buzzer turned off <<< \n");
26         }
27     }
28 }
```

The code is exactly the same as when we used a push button switch to control an LED. You can also try using the PNP transistor to achieve the same results.

## Project 6.2 Alertor

Next, we will use a passive buzzer to make an alarm.

The list of components and the circuit is similar to the doorbell project. We only need to take the Doorbell circuit and replace the active buzzer with a passive buzzer.

### Code

In this project, our buzzer alarm is controlled by the push button switch. Press the push button switch and the buzzer will sound. Release the push button switch and the buzzer will stop.

As stated before, it is analogous to our earlier project that controlled an LED ON and OFF.

To control a passive buzzer requires PWM of certain sound frequency.

#### C Code 6.2.1 Alertor

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)**

1. Use cd command to enter 06.2.1\_Alertor directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/06.2.1_Alertor
```

2. Use following command to compile "Alertor.c" and generate executable file "Alertor". "-lm" and "-lpthread" compiler options need to added here.

```
gcc Alertor.c -o Alertor -lwiringPi -lm -lpthread
```

3. Then run the generated file "Alertor".

```
sudo ./Alertor
```

After the program is executed, press the push button switch and the buzzer will sound. Release the push button switch and the buzzer will stop.

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <softTone.h>
4 #include <math.h>
5
6 #define buzzerPin 0 //define the buzzerPin
7 #define buttonPin 1 //define the buttonPin
8
9 void alertor(int pin){
10     int x;
11     double sinVal, toneVal;
12     for(x=0;x<360;x++) { // frequency of the alertor is consistent with the sine wave
13         sinVal = sin(x * (M_PI / 180)); //Calculate the sine value
14         toneVal = 2000 + sinVal * 500; //Add the resonant frequency and weighted sine value
15         softToneWrite(pin, toneVal); //output corresponding PWM
16         delay(1);

```

```

17     }
18 }
19 void stopAlertor(int pin) {
20     softToneWrite(pin, 0);
21 }
22 int main(void)
23 {
24     printf("Program is starting ... \n");
25
26     wiringPiSetup();
27
28     pinMode(buzzerPin, OUTPUT);
29     pinMode(buttonPin, INPUT);
30     softToneCreate(buzzerPin); //set buzzerPin
31     pullUpDnControl(buttonPin, PUD_UP); //pull up to HIGH level
32     while(1) {
33         if(digitalRead(buttonPin) == LOW){ //button is pressed
34             alertor(buzzerPin); // turn on buzzer
35             printf("alertor turned on >> \n");
36         }
37         else { //button is released
38             stopAlertor(buzzerPin); // turn off buzzer
39             printf("alertor turned off << \n");
40         }
41     }
42     return 0;
43 }
```

The code is the same to the active buzzer but the method is different. A passive buzzer requires PWM of a certain frequency, so you need to create a software PWM pin though softToneCreate (buzzerPin). Here softTone is designed to generate square waves with variable frequency and a duty cycle fixed to 50%, which is a better choice for controlling the buzzer.

	softToneCreate(buzzerRPin);
--	-----------------------------

In the while loop of the main function, when the push button switch is pressed the subfunction alertor() will be called and the alarm will issue a warning sound. The frequency curve of the alarm is based on a sine curve. We need to calculate the sine value from 0 to 360 degrees and multiplied by a certain value (here this value is 500) plus the resonant frequency of buzzer. We can set the PWM frequency through softToneWrite (pin, toneVal).

	void alertor(int pin){ int x; double sinVal, toneVal; for(x=0;x<360;x++){ //The frequency is based on the sine curve. sinVal = sin(x * (M_PI / 180)); toneVal = 2000 + sinVal * 500; } }
--	---

```
    softToneWrite(pin, toneVal);  
    delay(1);  
}  
}
```

If you want to stop the buzzer, just set PWM frequency of the buzzer pin to 0.

```
void stopAlertor(int pin) {  
    softToneWrite(pin, 0);  
}
```

The related functions of softTone are described as follows:

**int softToneCreate (int pin);**

This creates a software controlled tone pin.

**void softToneWrite (int pin, int freq);**

This updates the tone frequency value on the given pin.

For more details about softTone, please refer to :<http://wiringpi.com/reference/software-tone-library/>

# (Important) Chapter 7 ADC

We have learned how to control the brightness of an LED through PWM and that PWM is not a real analog signal. In this chapter, we will learn how to read analog values via an ADC Module and convert these analog values into digital.

## Project 7.1 Read the Voltage of Potentiometer

In this project, we will use the ADC function of an ADC Module to read the voltage value of a potentiometer.

### Component List

Raspberry Pi x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Jumper Wire M/M x16
Rotary potentiometer x1 	ADC module x1  <b>Or</b> 

This product contains **only one ADC module**, there are two types, PCF8591 and ADS7830. For the projects described in this tutorial, they function the same. Please build corresponding circuits according to the ADC module found in your Kit.

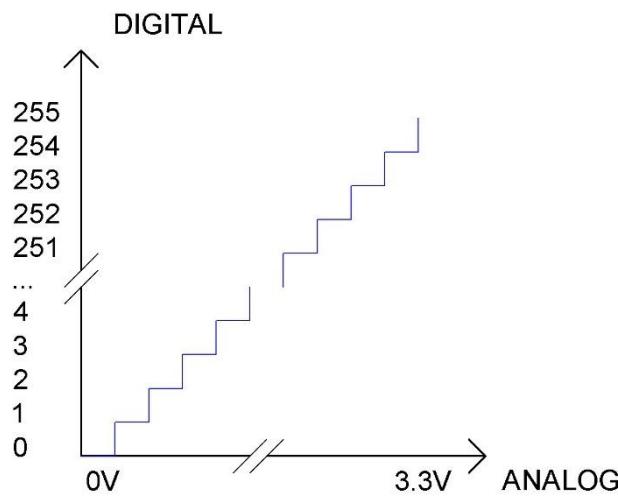

ADC module: PCF8591	ADC module: ADS7830
Model diagram 	Actual Picture 

## Circuit knowledge

### ADC

An ADC is an electronic integrated circuit used to convert analog signals such as voltages to digital or binary form consisting of 1s and 0s. The range of our ADC module is 8 bits, that means the resolution is  $2^8=256$ , so that its range (at 3.3V) will be divided equally to 256 parts.

Any analog value can be mapped to one digital value using the resolution of the converter. So the more bits the ADC has, the denser the partition of analog will be and the greater the precision of the resulting conversion.

Subsection 1: the analog in range of 0V-3.3/256 V corresponds to digital 0;

Subsection 2: the analog in range of 3.3 /256 V-2\*3.3 /256V corresponds to digital 1;

...

The resultant analog signal will be divided accordingly.

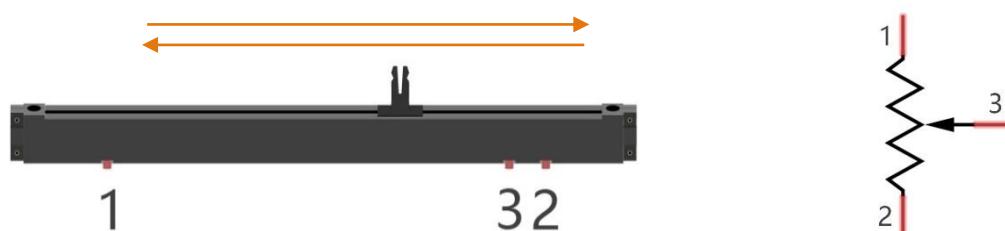

### DAC

The reversing this process requires a DAC, Digital-to-Analog Converter. The digital I/O port can output high level and low level (0 or 1), but cannot output an intermediate voltage value. This is where a DAC is useful. The DAC module PCF8591 has a DAC output pin with 8-bit accuracy, which can divide VDD (here is 3.3V) into  $2^8=256$  parts. For example, when the digital quantity is 1, the output voltage value is  $3.3/256 *1$  V, and when the digital quantity is 128, the output voltage value is  $3.3/256 *128=1.65$ V, the higher the accuracy of DAC, the higher the accuracy of output voltage value will be.

## Component knowledge

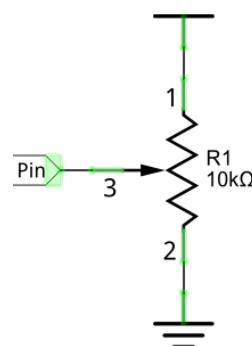

### Potentiometer

Potentiometer is a resistive element with three Terminal parts. Unlike the resistors that we have used thus far in our project which have a fixed resistance value, the resistance value of a potentiometer can be adjusted. A potentiometer is often made up by a resistive substance (a wire or carbon element) and movable contact brush. When the brush moves along the resistor element, there will be a change in the resistance of the potentiometer's output side (3) (or change in the voltage of the circuit that is a part). The illustration below represents a linear sliding potentiometer and its electronic symbol on the right.

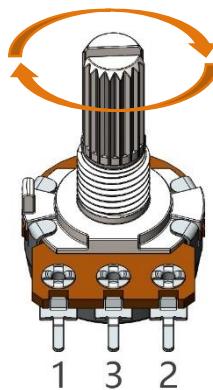

Between potentiometer pin 1 and pin 2 is the resistive element (a resistance wire or carbon) and pin 3 is connected to the brush that makes contact with the resistive element. In our illustration, when the brush moves from pin 1 to pin 2, the resistance value between pin 1 and pin 3 will increase linearly (until it reaches the highest value of the resistive element) and at the same time the resistance between pin 2 and pin 3 will decrease linearly and conversely down to zero. At the midpoint of the slider the measured resistance values between pin 1 and 3 and between pin 2 and 3 will be the same.

In a circuit, both sides of resistive element are often connected to the positive and negative electrodes of power. When you slide the brush "pin 3", you can get variable voltage within the range of the power supply.

### Rotary potentiometer

Rotary potentiometers and linear potentiometers have the same function; the only difference being the physical action being a rotational rather than a sliding movement.

### PCF8591

The PCF8591 is a single-chip, single-supply low power 8-bit CMOS data acquisition device with four analog inputs, one analog output and a serial I2C-bus interface. The following table is the pin definition diagram of PCF8591.

SYMBOL	PIN	DESCRIPTION	TOP VIEW
AIN0	1	Analog inputs (A/D converter)	
AIN1	2		
AIN2	3		
AIN3	4		
A0	5	Hardware address	
A1	6		
A2	7		
Vss	8	Negative supply voltage	
SDA	9	I2C-bus data input/output	
SCL	10	I2C-bus clock input	
OSC	11	Oscillator input/output	
EXT	12	external/internal switch for oscillator input	
AGND	13	Analog ground	
Vref	14	Voltage reference input	
AOUT	15	Analog output(D/A converter)	
Vdd	16	Positive supply voltage	

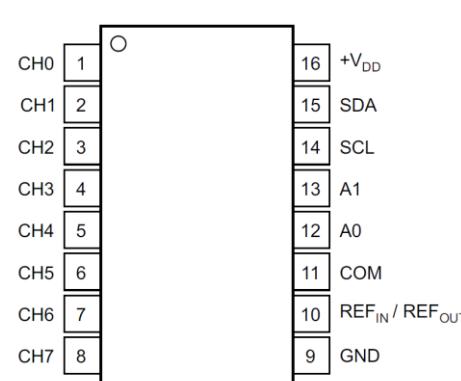

For more details about PCF8591, please refer to the datasheet which can be found on the Internet.

### ADS7830

The ADS7830 is a single-supply, low-power, 8-bit data acquisition device that features a serial I2C interface and an 8-channel multiplexer. The following table is the pin definition diagram of ADS7830.

SYMBOL	PIN	DESCRIPTION	TOP VIEW
CH0	1	Analog input channels (A/D converter)	
CH1	2		
CH2	3		
CH3	4		
CH4	5		

CH5	6	
CH6	7	
CH7	8	
GND	9	Ground
REF in/out	10	Internal +2.5V Reference, External Reference Input
COM	11	Common to Analog Input Channel
A0	12	Hardware address
A1	13	
SCL	14	Serial Clock
SDA	15	Serial Sata
+VDD	16	Power Supply, 3.3V Nominal

The pinout diagram shows the MCP3421 chip with its 16 pins numbered 1 through 16. Pin 1 is labeled with an open circle. The pins are grouped into two columns. The left column contains pins CH0 (1), CH1 (2), CH2 (3), CH3 (4), CH4 (5), CH5 (6), CH6 (7), and CH7 (8). The right column contains pins +V<sub>DD</sub> (16), SDA (15), SCL (14), A1 (13), A0 (12), COM (11), REF<sub>IN</sub> / REF<sub>OUT</sub> (10), and GND (9).

## I2C communication

I2C (Inter-Integrated Circuit) has a two-wire serial communication mode, which can be used to connect a micro-controller and its peripheral equipment. Devices using I2C communications must be connected to the serial data line (SDA), and serial clock line (SCL) (called I2C bus). Each device has a unique address which can be used as a transmitter or receiver to communicate with devices connected via the bus.

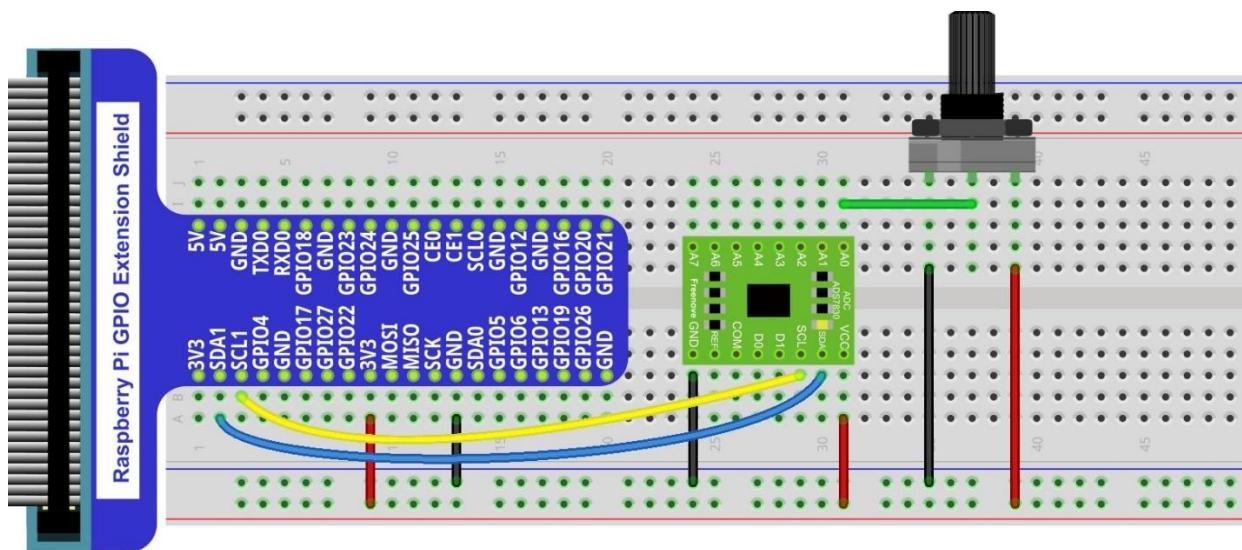

## Circuit with ADS7830

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

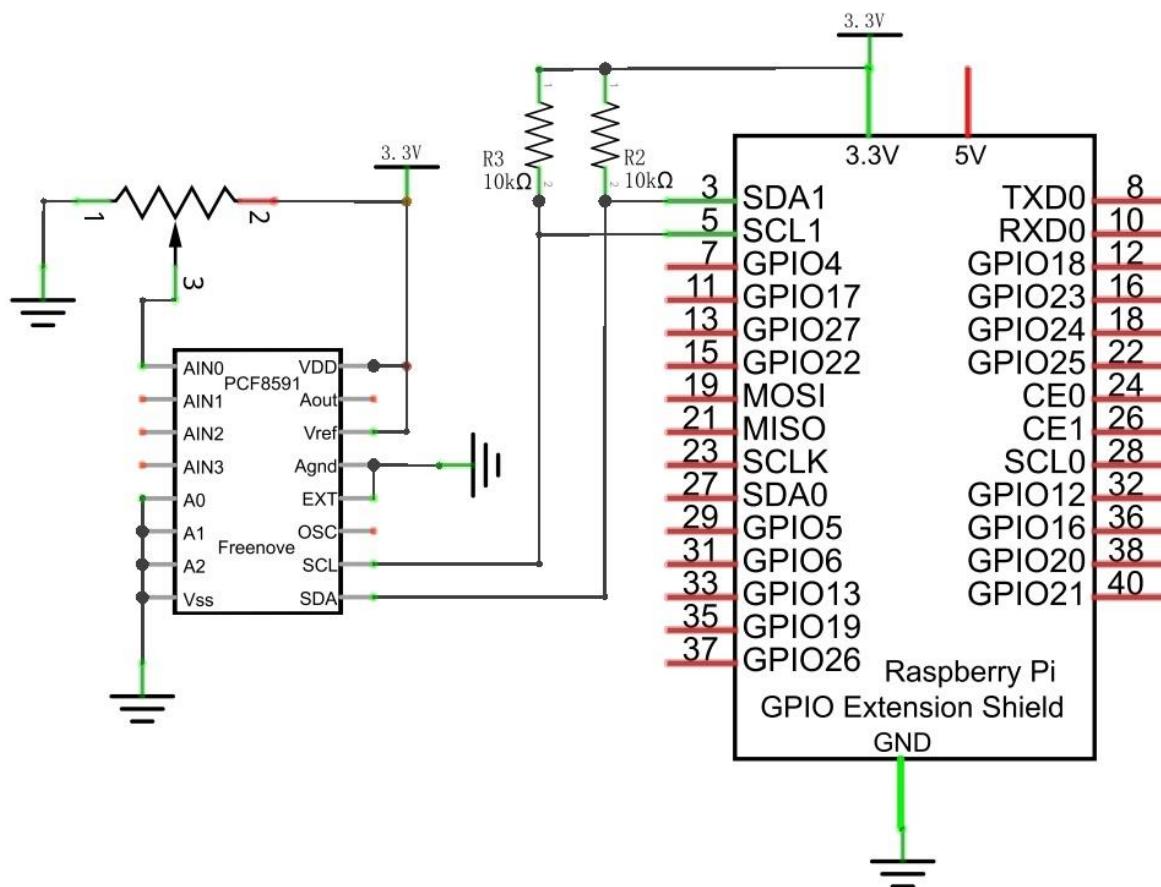

This product contains **only one ADC module**.

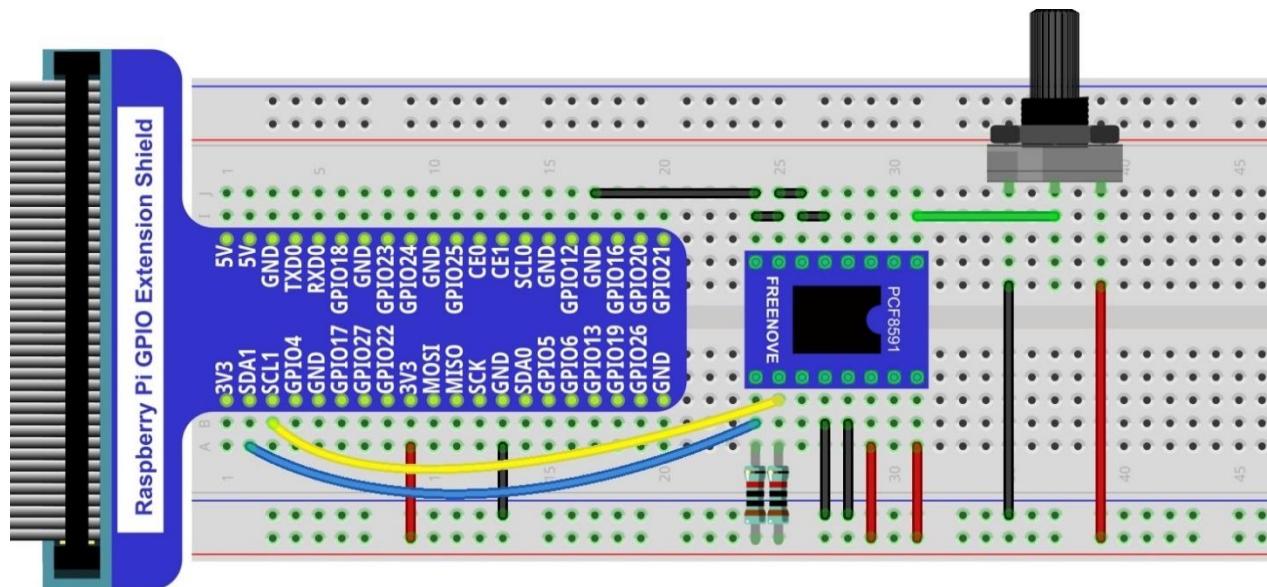

Video: [https://youtu.be/PSUCctu\\_DqA](https://youtu.be/PSUCctu_DqA)

## Circuit with PCF8591

Schematic diagram

Hardware connection

Please keep the **chip mark** consistent to make the chips under right direction and position.

## Configure I2C and Install Smbus

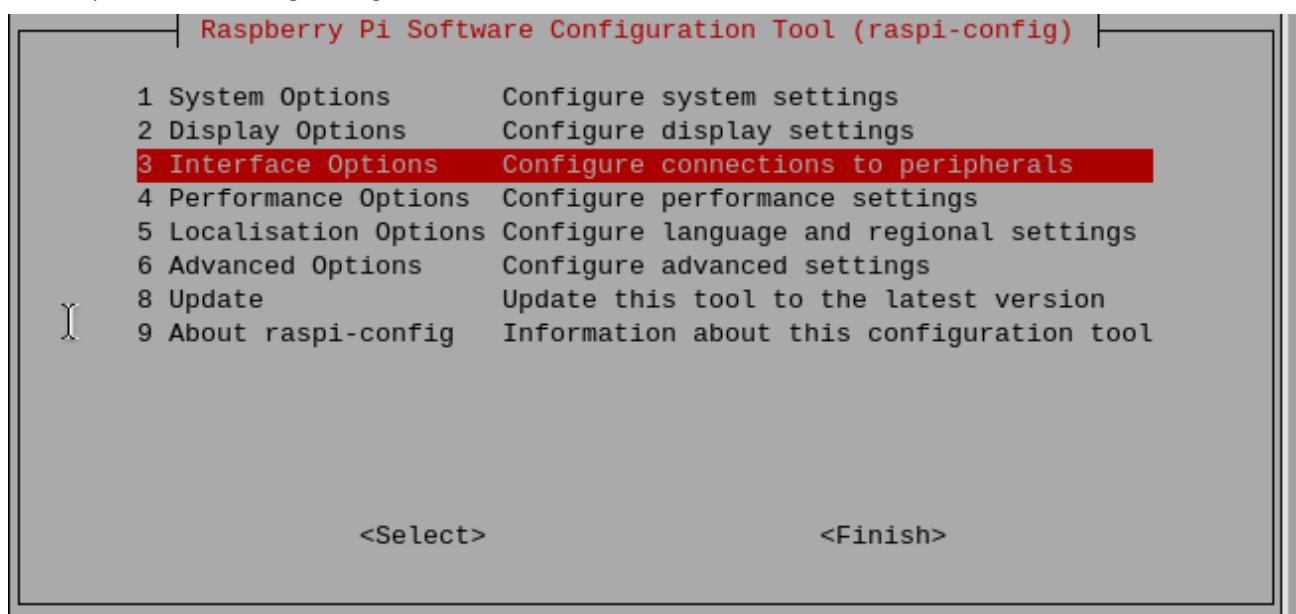

### Enable I2C

The I2C interface in Raspberry Pi is disabled by default. You will need to open it manually and enable the I2C interface as follows:

Type command in the Terminal:

```
sudo raspi-config
```

Then open the following dialog box:

Choose “3 Interfacing Options” then “I4 I2C” then “Yes” and then “Finish” in this order and restart your RPi. The I2C module will then be started.

Type a command to check whether the I2C module is started:

```
lsmod | grep i2c
```

If the I2C module has been started, the following content will be shown. “bcm2708” refers to the CPU model. Different models of Raspberry Pi display different contents depending on the CPU installed:

```
pi@raspberrypi:~ $ lsmod | grep i2c
i2c_bcm2708          4770  0
i2c_dev              5859  0
pi@raspberrypi:~ $
```

## Install I2C-Tools

Next, type the command to install I2C-Tools. It is available with the Raspberry Pi OS by default.

```
sudo apt-get install i2c-tools
```

I2C device address detection:

```
i2cdetect -y 1
```

When you are using the PCF8591 Module, the result should look like this:

```
pi@raspberrypi:~ $ i2cdetect -y 1
  0  1  2  3  4  5  6  7  8  9  a  b  c  d  e  f
00: -----
10: -----
20: -----
30: -----
40: ----- 48 -----
50: -----
60: -----
70: -----
```

Here, 48 (HEX) is the I2C address of ADC Module (PCF8591).

When you are using ADS, the result should look like this:

```
pi@raspberrypi:~ $ i2cdetect -y 1
  0  1  2  3  4  5  6  7  8  9  a  b  c  d  e  f
00: -----
10: -----
20: -----
30: -----
40: ----- 4b -----
50: -----
60: -----
70: -----
```

Here, 4b (HEX) is the I2C address of ADC Module (ADS7830).

## Code

### C Code 7.1.1 ADC

For C code for the ADC Device, a custom library needs to be installed.

1. Use cd command to enter folder of the ADC Device library.

```
cd ~/Freenove_Kit/Libs/C-Libs/ADCDevice
```

2. Execute command below to install the library.

```
sh ./build.sh
```

A successful installation, without error prompts, is shown below:

```
pi@raspberrypi:~/Freenove_Kit/Libs/C-Libs/ADCDevice $ sh ./build.sh
build completed!
```

Next, we will execute the code for this project.

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 07.1.1\_ADC directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/07.1.1_ADC
```

2. Use following command to compile "ADC.cpp" and generate the executable file "ADC".

```
g++ ADC.cpp -o ADC -lwiringPi -IADCDevice
```

3. Then run the generated file "ADC".

```
sudo ./ADC
```

After the program is executed, adjusting the potentiometer will produce a readout display of the potentiometer voltage values in the Terminal and the converted digital content.

```
ADC value : 135 , Voltage : 1.75V
ADC value : 135 , Voltage : 1.75V
ADC value : 136 , Voltage : 1.76V
ADC value : 141 , Voltage : 1.82V
ADC value : 144 , Voltage : 1.86V
ADC value : 146 , Voltage : 1.89V
ADC value : 148 , Voltage : 1.92V
ADC value : 149 , Voltage : 1.93V
ADC value : 149 , Voltage : 1.93V
ADC value : 144 , Voltage : 1.86V
ADC value : 143 , Voltage : 1.85V
ADC value : 143 , Voltage : 1.85V
ADC value : 142 , Voltage : 1.84V
ADC value : 141 , Voltage : 1.82V
```

The following is the code:

```
1 #include <wiringPi.h>
2 #include <wiringPiI2C.h>
3 #include <stdio.h>
4 #include <ADCDevice.hpp>
5
6 ADCDevice *adc; // Define an ADC Device class object
7
8 int main(void){
9     adc = new ADCDevice();
10    printf("Program is starting ... \n");
11
12    if(adc->detectI2C(0x48)){ // Detect the pcf8591.
13        delete adc;
14        adc = new PCF8591(); // If detected, create an instance of PCF8591.
15    }
16    else if(adc->detectI2C(0x4b)){// Detect the ads7830
17        delete adc;
18        adc = new ADS7830(); // If detected, create an instance of ADS7830.
```

```

19 }
20 else{
21     printf("No correct I2C address found, \n"
22         "Please use command 'i2cdetect -y 1' to check the I2C address! \n"
23         "Program Exit. \n");
24     return -1;
25 }
26
27 while(1){
28     int adcValue = adc->analogRead(0); //read analog value of A0 pin
29     float voltage = (float)adcValue / 255.0 * 3.3; // Calculate voltage
30     printf("ADC value : %d , \tVoltage : %.2fV\n", adcValue, voltage);
31     delay(100);
32 }
33 }
```

In this code, a custom class library "ADCDevice" is used. It contains the method of utilizing the ADC Module in this project, through which the ADC Module can easily and quickly be used. In the code, you need to first create a class pointer adc, and then point to an instantiated object. (Note: An instantiated object is given a name and created in memory or on disk using the structure described within a class declaration.)

```

ADCDDevice *adc; // Define an ADC Device class object
.....
adc = new ADCDevice();
```

Then use the member function detectI2C(addr) in the class to detect the I2C module in the circuit. Different modules have different I2C addresses. Therefore, according to the different addresses, we can determine what the ADC module is in the circuit. When the correct module is detected, the pointer adc will point to the address of the object, and then the previously pointed content will be deleted to free memory. The default address of ADC module PCF8591 is 0x48, and that of ADC module ADS7830 is 0x4b.

```

if(adc->detectI2C(0x48)){ // Detect the pcf8591.
    delete adc;
    adc = new PCF8591(); // If detected, create an instance of PCF8591.
}
else if(adc->detectI2C(0x4b)){// Detect the ads7830
    delete adc;
    adc = new ADS7830(); // If detected, create an instance of ADS7830.
}
else{
    printf("No correct I2C address found, \n"
        "Please use command 'i2cdetect -y 1' to check the I2C address! \n"
        "Program Exit. \n");
    return -1;
}
```

When you have a class object pointed to a specific device, you can get the ADC value of the specific channel by calling the member function `analogRead(chn)` in this class

```
int adcValue = adc->analogRead(0); //read analog value of A0 pin
```

Then according to the formula, the voltage value is calculated and displayed on the Terminal.

```
float voltage = (float)adcValue / 255.0 * 3.3; // Calculate voltage
printf("ADC value : %d , \tVoltage : %.2fV\n", adcValue, voltage);
```

## Reference

```
class ADCDevice
```

This is a base class. All ADC module classes are its derived classes. It has a real function and a virtual function.

```
int detectI2C(int addr);
```

This is a real function, which is used to detect whether the device with given I2C address exists. If it exists, return 1, otherwise return 0.

```
virtual int analogRead(int chn);
```

This is a virtual function that reads the ADC value of the specified channel. It is implemented in a derived class.

```
class PCF8591:public ADCDevice
class ADS7830:public ADCDevice
```

These two classes are derived from the `ADCDevice` class and mainly implement the function `analogRead(chn)`.

```
int analogRead(int chn);
```

This returns the value read on the supplied analog input pin.

Parameter `chn`: For `PCF8591`, the range of `chn` is 0, 1, 2, 3. For `ADS7830`, the range of is 0, 1, 2, 3, 4, 5, 6, 7.

You can find the source file of this library in the folder below:

```
~/Freenove_Kit/Libs/C-Libs/ADCDevice/
```

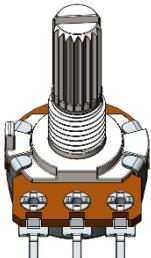

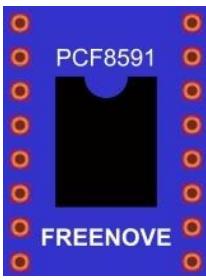

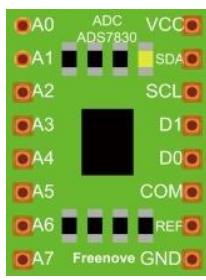

# Chapter 8 Potentiometer & LED

Earlier we learned how to use ADC and PWM. In this chapter, we learn to control the brightness of an LED by using a potentiometer.

## Project 8.1 Soft Light

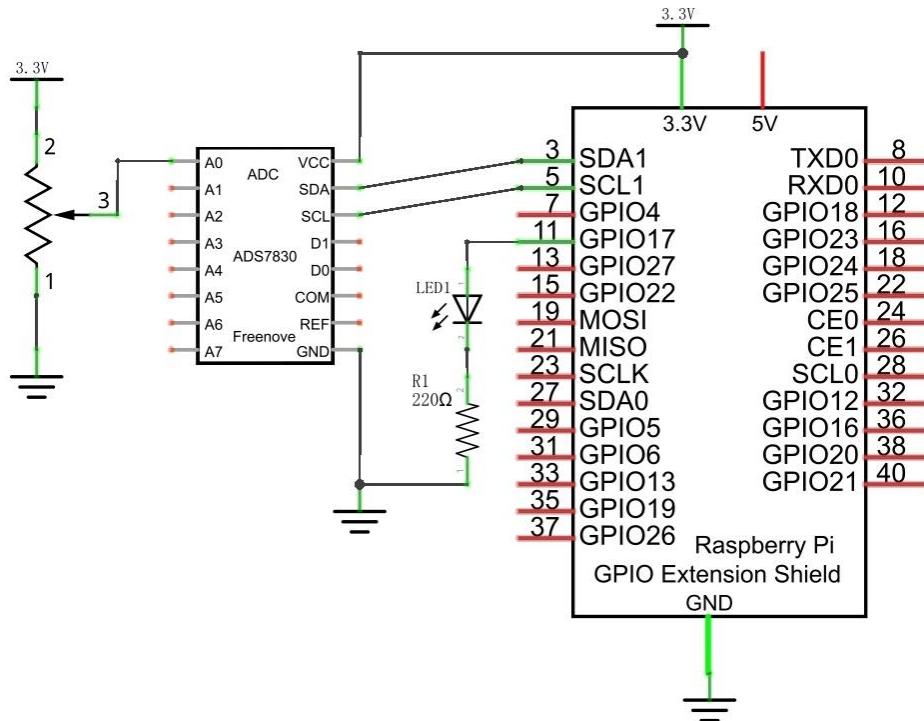

In this project, we will make a soft light. We will use an ADC Module to read ADC values of a potentiometer and map it to duty cycle ratio of the PWM used to control the brightness of an LED. Then you can change the brightness of an LED by adjusting the potentiometer.

### Component List

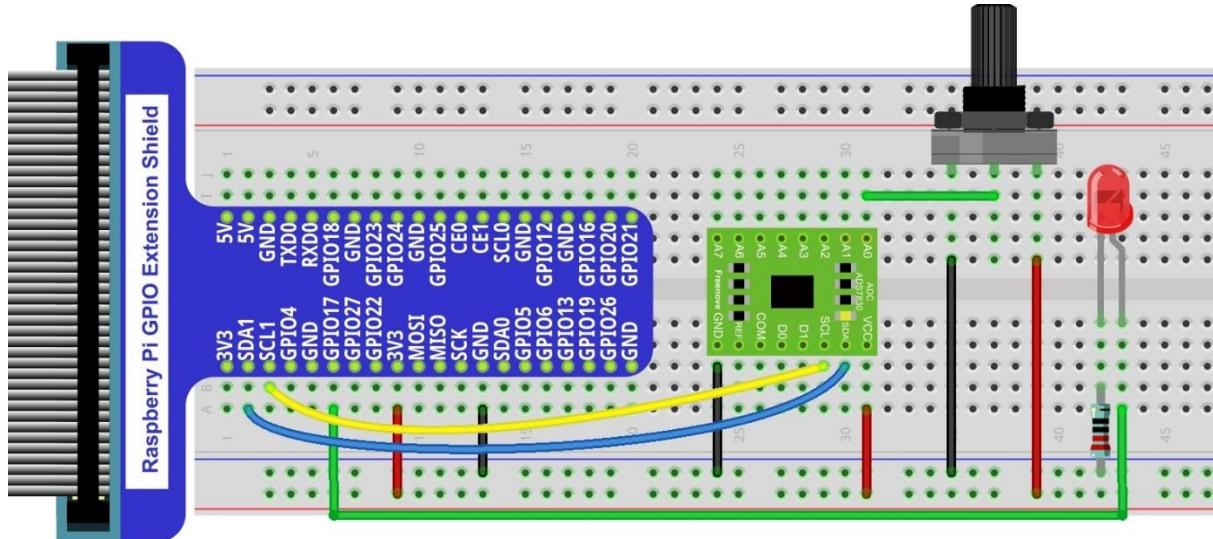

Raspberry Pi x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Jumper Wire M/M x17			
Rotary Potentiometer x1 	ADC Module x1 ( <b>Only one</b> )  <b>Or</b> 	10kΩ x2	220Ω x1	LED x1

## Circuit with ADS7830

Hardware connection

## Code

### C Code 8.1.1 Softlight

If you did not [configure I2C](#), please refer to [Chapter 7](#). If you did, please move on.

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 08.1.1\_Softlight directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/08.1.1_Softlight
```

2. Use following command to compile "Softlight.cpp" and generate executable file "Softlight".

```
g++ Softlight.cpp -o Softlight -lwiringPi -IADCDevice
```

3. Then run the generated file "Softlight".

```
sudo ./Softlight
```

After the program is executed, adjusting the potentiometer will display the voltage values of the potentiometer in the Terminal window and the converted digital quantity. As a consequence, the brightness of LED will be changed.

The following is the code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <softPwm.h>
4 #include <ADCDevice.hpp>
5
6 #define ledPin 0
7
8 ADCDevice *adc; // Define an ADC Device class object
9
10 int main(void){
11     adc = new ADCDevice();
12     printf("Program is starting ... \n");
13
14     if(adc->detectI2C(0x48)){ // Detect the pcf8591.
15         delete adc;           // Free previously pointed memory
16         adc = new PCF8591(); // If detected, create an instance of PCF8591.
17     }
18     else if(adc->detectI2C(0x4b)){// Detect the ads7830
19         delete adc;           // Free previously pointed memory
20         adc = new ADS7830(); // If detected, create an instance of ADS7830.
21     }
22     else{
23         printf("No correct I2C address found, \n"
24             "Please use command 'i2cdetect -y 1' to check the I2C address! \n"
25             "Program Exit. \n");
26     }
27 }
```

```
26     return -1;
27 }
28 wiringPiSetup();
29 softPwmCreate(ledPin, 0, 100);
30 while(1){
31     int adcValue = adc->analogRead(0);      //read analog value of A0 pin
32     softPwmWrite(ledPin, adcValue*100/255);    // Mapping to PWM duty cycle
33     float voltage = (float)adcValue / 255.0 * 3.3; // Calculate voltage
34     printf("ADC value : %d , Voltage : %.2fV\n", adcValue, voltage);
35     delay(30);
36 }
37 return 0;
38 }
```

In the code, read the ADC value of potentiometer and map it to the duty cycle of PWM to control LED brightness.

```
int adcValue = adc->analogRead(0);      //read analog value of A0 pin
softPwmWrite(ledPin, adcValue*100/255);    // Mapping to PWM duty cycle
```

# Chapter 9 Potentiometer & RGBLED

In this chapter, we will use 3 potentiometers to control the brightness of 3 LEDs of RGBLED to create multiple colors.

## Project 9.1 Colorful Light

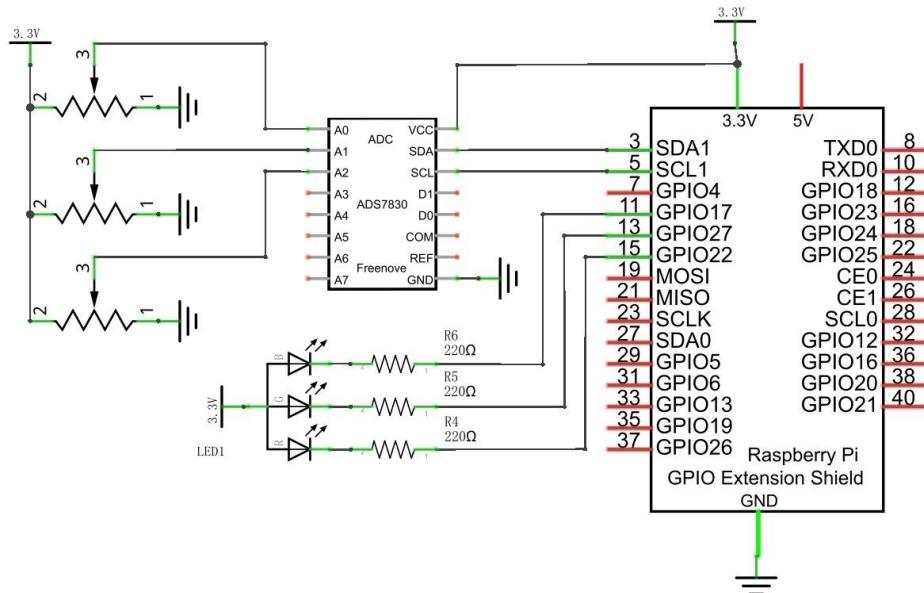

In this project, 3 potentiometers are used to control the RGB LED and in principle it is the same as with the Soft Light project. Namely, read the voltage value of the potentiometer and then convert it to PWM used to control LED brightness. Difference is that the previous soft light project needed only one LED while this one required (3) RGB LEDs.

## Component List

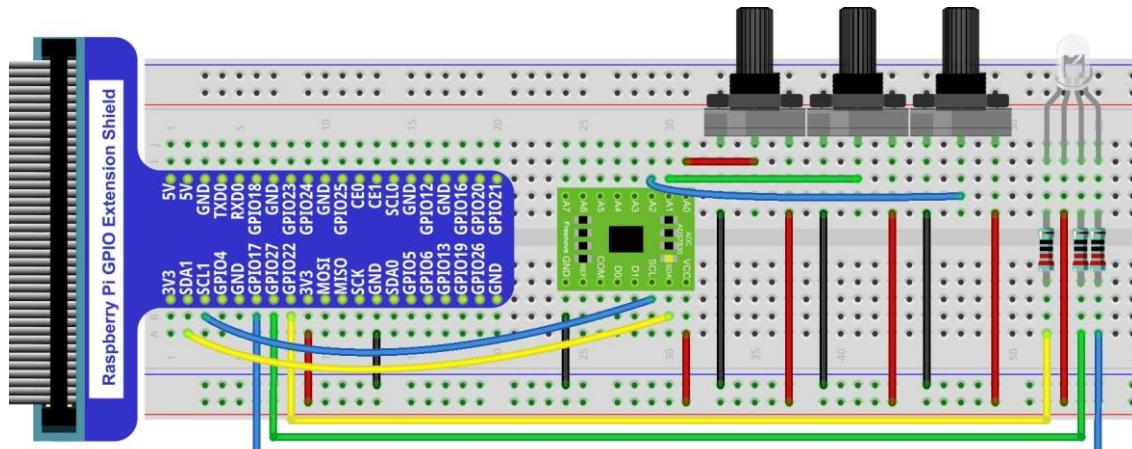

Raspberry Pi x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Jumper Wires M/M x17 			
Rotary potentiometer x3 	ADC module x1 PCF8591 FREENOVE or 			RGB LEDx1 

## Circuit with ADS7830

## Code

### C Code 9.1.1 Colorful Softlight

If you did not [configure I2C](#), please refer to [Chapter 7](#). If you did, please continue.

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 09.1.1\_ColorfulSoftlight directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/09.1.1_ColorfulSoftlight
```

2. Use following command to compile "ColorfulSoftlight.cpp" and generate executable file "ColorfulSoftlight".

```
g++ ColorfulSoftlight.cpp -o ColorfulSoftlight -lwiringPi -IADCDevice
```

3. Then run the generated file "ColorfulSoftlight".

```
sudo ./ColorfulSoftlight
```

After the program is executed, rotate one of the potentiometers, then the color of RGB LED will change. The Terminal window will display the ADC value of each potentiometer.

```
ADC value val_Red: 147 , val_Green: 192 , val_Blue: 238
ADC value val_Red: 147 , val_Green: 192 , val_Blue: 206
ADC value val_Red: 147 , val_Green: 192 , val_Blue: 174
ADC value val_Red: 147 , val_Green: 192 , val_Blue: 152
ADC value val_Red: 147 , val_Green: 192 , val_Blue: 139
ADC value val_Red: 147 , val_Green: 192 , val_Blue: 138
ADC value val_Red: 147 , val_Green: 192 , val_Blue: 138
ADC value val_Red: 147 , val_Green: 192 , val_Blue: 138
ADC value val_Red: 147 , val_Green: 192 , val_Blue: 138
```

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <softPwm.h>
4 #include <ADCDevice.hpp>
5
6 #define ledRedPin 3           //define 3 pins for RGBLED
7 #define ledGreenPin 2
8 #define ledBluePin 0
9
10 ADCDevice *adc; // Define an ADC Device class object
11
12 int main(void) {
13     adc = new ADCDevice();
14     printf("Program is starting ... \n");
15
16     if(adc->detectI2C(0x48)){ // Detect the pcf8591.
17         delete adc;          // Free previously pointed memory
```

```

18         adc = new PCF8591();    // If detected, create an instance of PCF8591.
19     }
20     else if(adc->detectI2C(0x4b)){// Detect the ads7830
21         delete adc;           // Free previously pointed memory
22         adc = new ADS7830();   // If detected, create an instance of ADS7830.
23     }
24     else{
25         printf("No correct I2C address found, \n"
26             "Please use command 'i2cdetect -y 1' to check the I2C address! \n"
27             "Program Exit. \n");
28         return -1;
29     }
30     wiringPiSetup();
31     softPwmCreate(ledRedPin, 0, 100);      //creat 3 PMW output pins for RGBLED
32     softPwmCreate(ledGreenPin, 0, 100);
33     softPwmCreate(ledBluePin, 0, 100);
34     while(1){
35         int val_Red = adc->analogRead(0); //read analog value of 3 potentiometers
36         int val_Green = adc->analogRead(1);
37         int val_Blue = adc->analogRead(2);
38         softPwmWrite(ledRedPin, val_Red*100/255); //map the read value of potentiometers
into PWM value and output it
39         softPwmWrite(ledGreenPin, val_Green*100/255);
40         softPwmWrite(ledBluePin, val_Blue*100/255);
41         //print out the read ADC value
42         printf("ADC value val_Red: %d ,\tval_Green: %d ,\tval_Blue: %d
43 \n", val_Red, val_Green, val_Blue);
44         delay(100);
45     }
46     return 0;
47 }
```

In the code you can read the ADC values of the 3 potentiometers and map it into a PWM duty cycle to control the 3 LED elements to vary the color of their respective RGB LED.

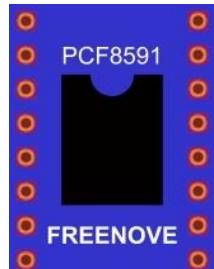

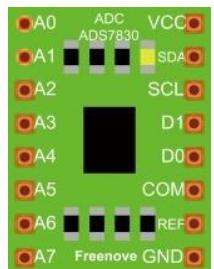

# Chapter 10 Photoresistor & LED

In this chapter, we will learn how to use a photoresistor to make an automatic dimming nightlight.

## Project 10.1 NightLamp

A Photoresistor is very sensitive to the amount of light present. We can take advantage of the characteristic to make a nightlight with the following function. When the ambient light is less (darker environment), the LED will automatically become brighter to compensate and when the ambient light is greater (brighter environment) the LED will automatically dim to compensate.

## Component List

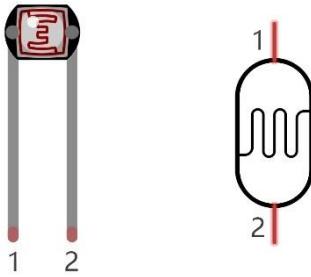

Raspberry Pi x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Jumper Wires M/M x15			
Photoresistor x1 	ADC module x1  or 	10kΩ x3	220Ω x1	LED x1 

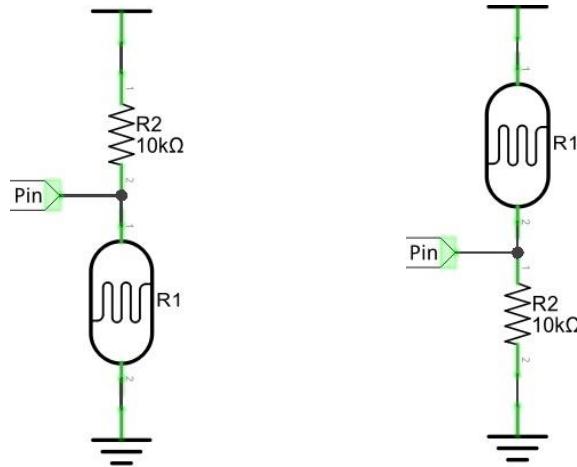

## Component knowledge

### Photoresistor

A Photoresistor is simply a light sensitive resistor. It is an active component that decreases resistance with respect to receiving luminosity (light) on the component's light sensitive surface. A Photoresistor's resistance value will change in proportion to the ambient light detected. With this characteristic, we can use a Photoresistor to detect light intensity. The Photoresistor and its electronic symbol are as follows.

The circuit below is used to detect the change of a Photoresistor's resistance value:

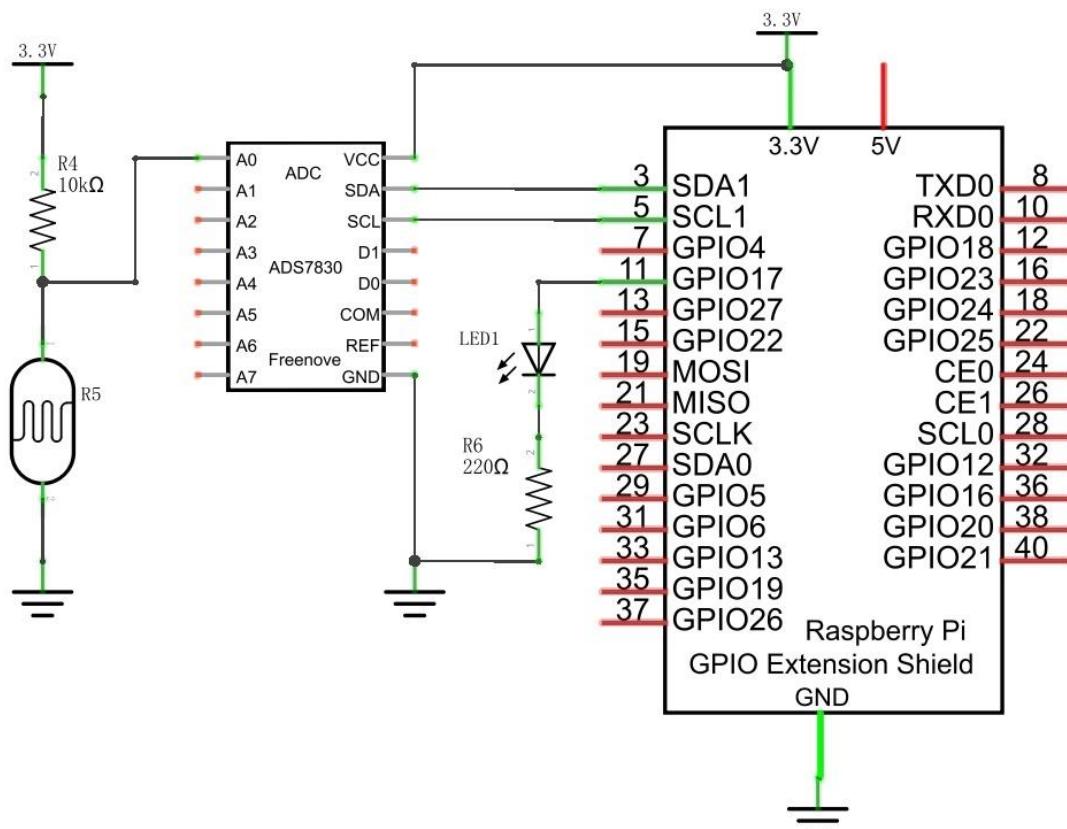

In the above circuit, when a Photoresistor's resistance value changes due to a change in light intensity, the voltage between the Photoresistor and Resistor R1 will also change. Therefore, the intensity of the light can be obtained by measuring this voltage.

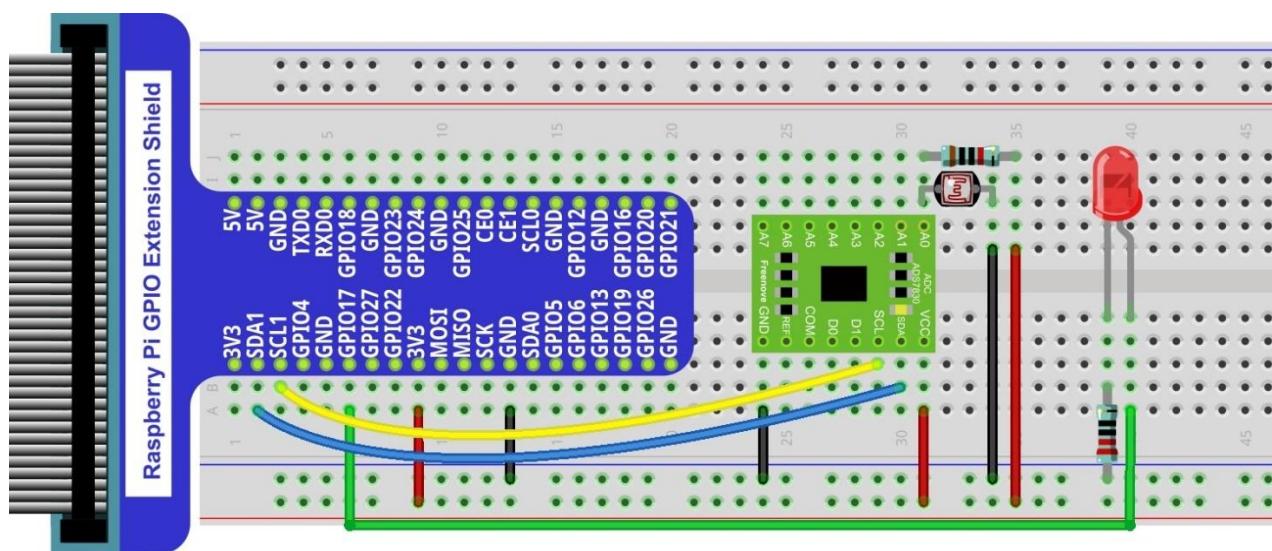

## Circuit with ADS7830

The circuit used is similar to the Soft light project. The only difference is that the input signal of the AIN0 pin of ADC changes from a Potentiometer to a combination of a Photoresistor and a Resistor.

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

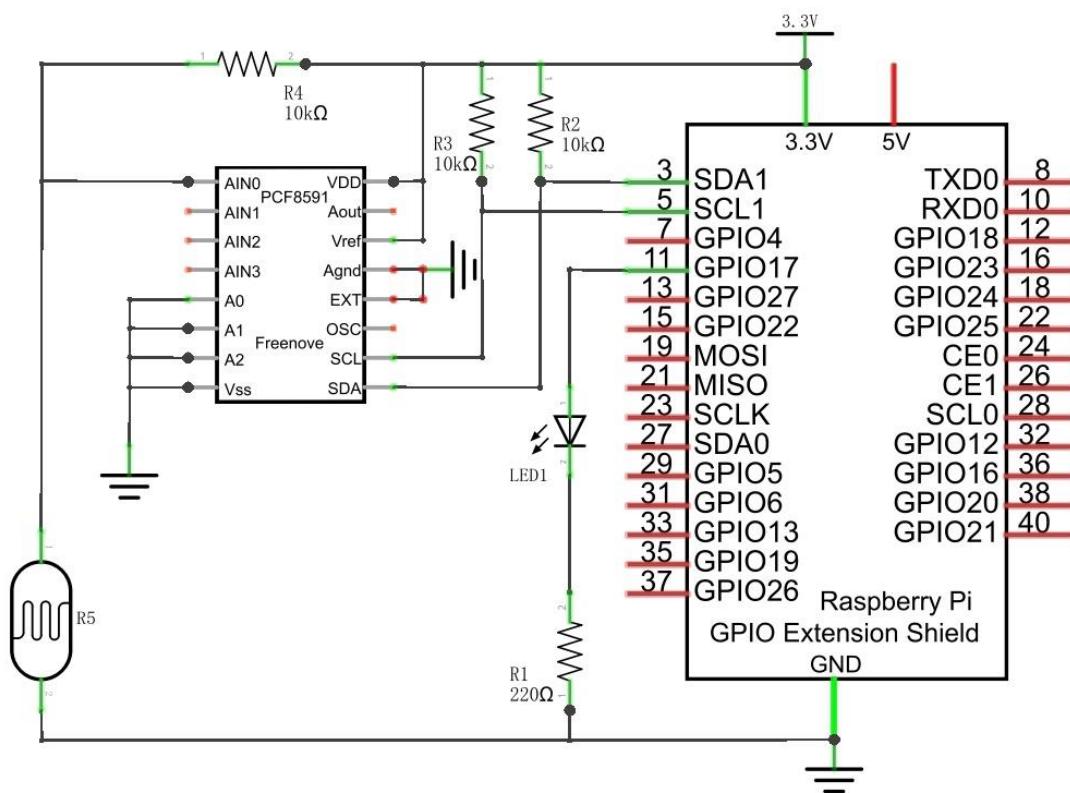

[Video: https://youtu.be/r6p3zhXsyko](https://youtu.be/r6p3zhXsyko)

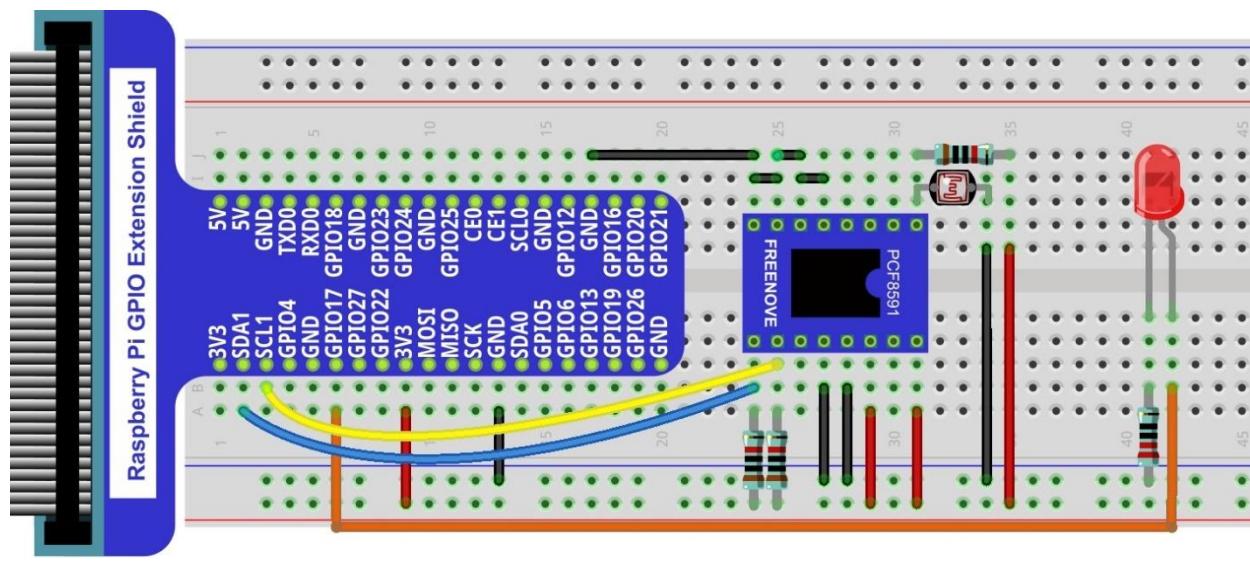

## Circuit with PCF8591

The circuit used is similar to the Soft light project. The only difference is that the input signal of the AIN0 pin of ADC changes from a Potentiometer to a combination of a Photoresistor and a Resistor.

Schematic diagram

Hardware connection

## Code

The code used in this project is identical with what was used in the last chapter.

### C Code 10.1.1 Nightlamp

If you did not [configure I2C](#), please refer to [Chapter 7](#). If you did, please continue.

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 10.1.1\_Nightlamp directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/10.1.1_Nightlamp
```

2. Use following command to compile "Nightlamp.cpp" and generate executable file "Nightlamp".

```
g++ Nightlamp.cpp -o Nightlamp -lwiringPi -IADCDevice
```

3. Then run the generated file "Nightlamp".

```
sudo ./Nightlamp
```

After the program is executed, if you cover the Photoresistor or increase the light shining on it, the brightness of the LED changes accordingly. As in previous projects the Terminal window will display the current input voltage value of ADC module A0 pin and the converted digital quantity.

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <softPwm.h>
4 #include <ADCDevice.hpp>
5
6 #define ledPin 0
7
8 ADCDevice *adc; // Define an ADC Device class object
9
10 int main(void){
11     adc = new ADCDevice();
12     printf("Program is starting ... \n");
13
14     if(adc->detectI2C(0x48)){ // Detect the pcf8591.
15         delete adc;           // Free previously pointed memory
16         adc = new PCF8591(); // If detected, create an instance of PCF8591.
17     }
18     else if(adc->detectI2C(0x4b)){// Detect the ads7830
19         delete adc;           // Free previously pointed memory
20         adc = new ADS7830(); // If detected, create an instance of ADS7830.
21     }
22     else{
23         printf("No correct I2C address found, \n"
24             "Please use command 'i2cdetect -y 1' to check the I2C address! \n"
25             "Program Exit. \n");
26     }
27 }
```

```
26         return -1;
27     }
28     wiringPiSetup();
29     softPwmCreate(ledPin, 0, 100);
30     while(1){
31         int value = adc->analogRead(0); //read analog value of A0 pin
32         softPwmWrite(ledPin, value*100/255);
33         float voltage = (float)value / 255.0 * 3.3; // calculate voltage
34         printf("ADC value : %d , \tVoltage : %.2fV\n", value, voltage);
35         delay(100);
36     }
37     return 0;
38 }
```

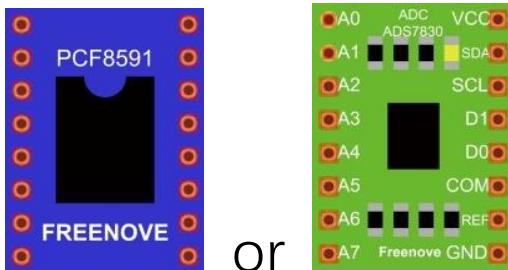

# Chapter 11 Thermistor

In this chapter, we will learn about Thermistors which are another kind of Resistor.

## Project 11.1 Thermometer

A Thermistor is a type of Resistor whose resistance value is dependent on temperature and changes in temperature. Therefore, we can take advantage of this characteristic to make a Thermometer.

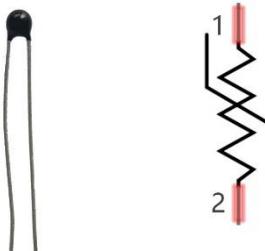

## Component List

Raspberry Pi x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Jumper Wire M/M x14
Thermistor x1 	ADC module x1  or

## Component knowledge

### Thermistor

Thermistor is a temperature sensitive resistor. When it senses a change in temperature, the resistance of the Thermistor will change. We can take advantage of this characteristic by using a Thermistor to detect temperature intensity. A Thermistor and its electronic symbol are shown below.

The relationship between resistance value and temperature of a thermistor is:

$$R_t = R \cdot \exp[B \cdot (1/T_2 - 1/T_1)]$$

Where:

**Rt** is the thermistor resistance under T2 temperature;

**R** is the nominal resistance of thermistor under T1 temperature;

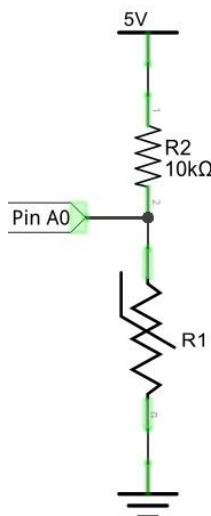

**EXP[n]** is nth power of e;

**B** is for thermal index;

**T1, T2** is Kelvin temperature (absolute temperature). Kelvin temperature = 273.15 + Celsius temperature.

For the parameters of the Thermistor, we use: B=3950, R=10k, T1=25.

The circuit connection method of the Thermistor is similar to photoresistor, as the following:

We can use the value measured by the ADC converter to obtain the resistance value of Thermistor, and then we can use the formula to obtain the temperature value.

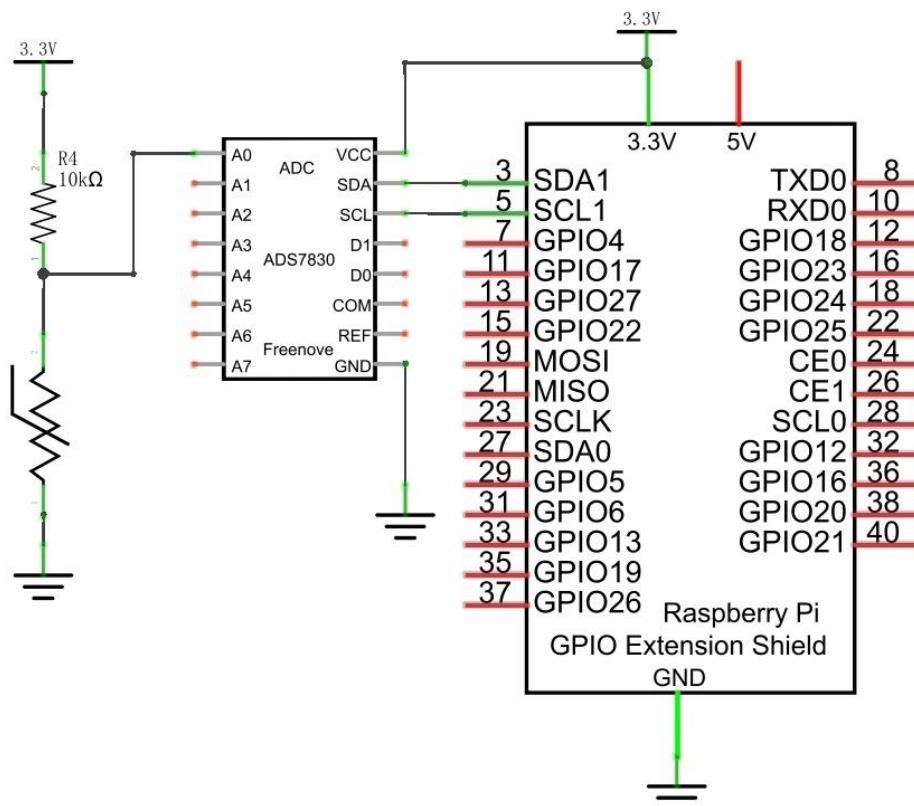

Therefore, the temperature formula can be derived as:

$$T_2 = 1 / (1/T_1 + \ln(R_t/R)/B)$$

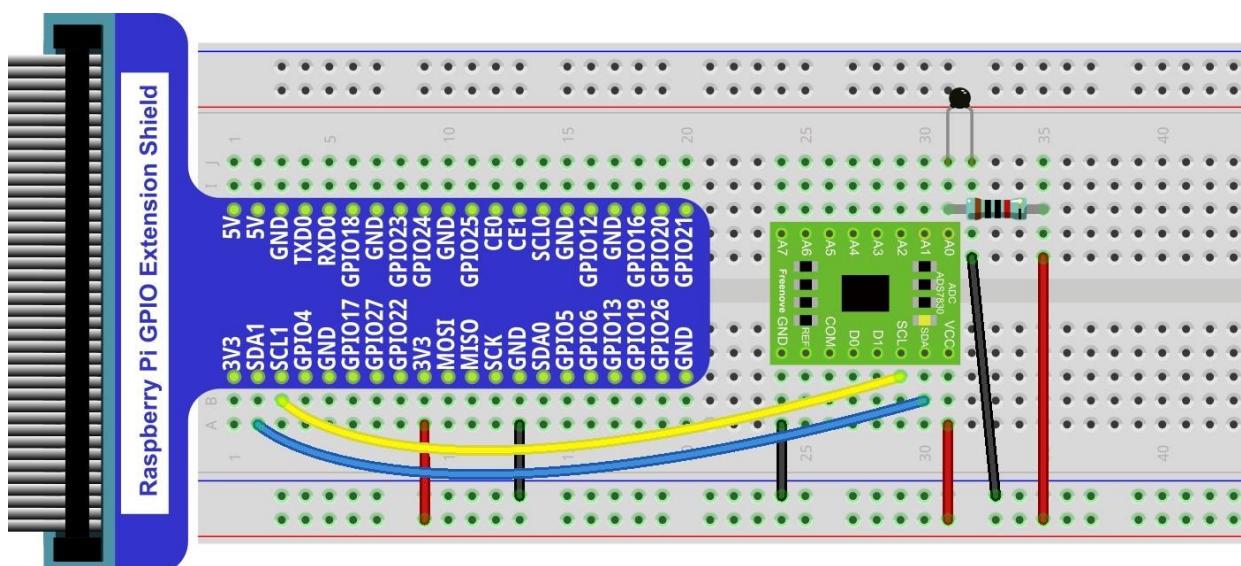

## Circuit with ADS7830

The circuit of this project is similar to the one in last chapter. The only difference is that the Photoresistor is replaced by the Thermistor.

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

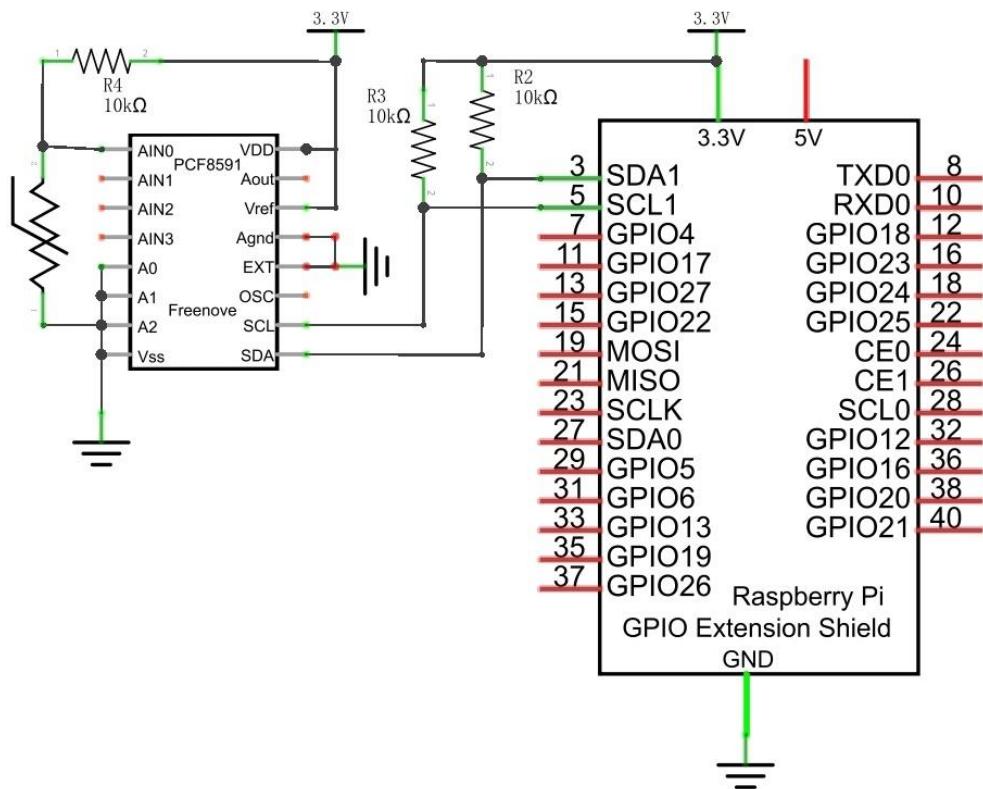

Thermistor has **longer pins** than the one shown in circuit.

Video: <https://youtu.be/spOalxanNMc>

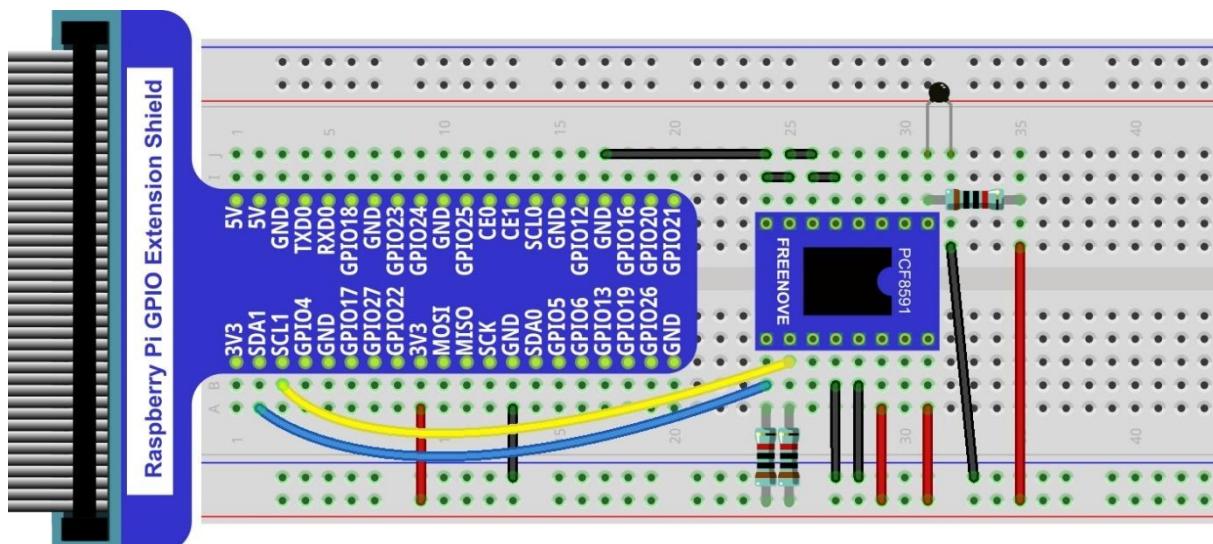

## Circuit with PCF8591

The circuit of this project is similar to the one in the last chapter. The only difference is that the Photoresistor is replaced by the Thermistor.

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

Thermistor has longer pins than the one shown in circuit.

## Code

In this project code, the ADC value still needs to be read, but the difference here is that a specific formula is used to calculate the temperature value.

### C Code 11.1.1 Thermometer

If you did not [configure I2C](#), please refer to [Chapter 7](#). If you did, please continue.

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 11.1.1\_Termometer directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/11.1.1_Termometer
```

- 2 Use following command to compile “Thermometer.cpp” and generate executable file “Thermometer”.

```
g++ Thermometer.cpp -o Thermometer -lwiringPi -IADCDevice
```

- 3 Then run the generated file “Thermometer”.

```
sudo ./Thermometer
```

After the program is executed, the Terminal window will display the current ADC value, voltage value and temperature value. Try to “pinch” the thermistor (without touching the leads) with your index finger and thumb for a brief time, you should see that the temperature value increases.

```
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
ADC value : 105 , Voltage : 1.36V, Temperature : 33.25C
```

The following is the code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <math.h>
4 #include <ADCDevice.hpp>
5
6 ADCDevice *adc; // Define an ADC Device class object
7
8 int main(void){
9     adc = new ADCDevice();
10    printf("Program is starting ... \n");
```

```
11
12     if(adc->detectI2C(0x48)){ // Detect the pcf8591.
13         delete adc;           // Free previously pointed memory
14         adc = new PCF8591(); // If detected, create an instance of PCF8591.
15     }
16     else if(adc->detectI2C(0x4b)){// Detect the ads7830
17         delete adc;           // Free previously pointed memory
18         adc = new ADS7830(); // If detected, create an instance of ADS7830.
19     }
20     else{
21         printf("No correct I2C address found, \n"
22             "Please use command 'i2cdetect -y 1' to check the I2C address! \n"
23             "Program Exit. \n");
24         return -1;
25     }
26     printf("Program is starting ... \n");
27     while(1){
28         int adcValue = adc->analogRead(0); //read analog value A0 pin
29         float voltage = (float)adcValue / 255.0 * 3.3; // calculate voltage
30         float Rt = 10 * voltage / (3.3 - voltage); //calculate resistance value of thermistor
31         float tempK = 1/(1/(273.15 + 25) + log(Rt/10)/3950.0); //calculate temperature (Kelvin)
32         float tempC = tempK -273.15; //calculate temperature (Celsius)
33         printf("ADC value : %d , \tVoltage : %.2fV,
34 \tTemperature : %.2fC\n",adcValue,voltage,tempC);
35         delay(100);
36     }
37     return 0;
38 }
```

In the code, the ADC value of ADC module A0 port is read, and then calculates the voltage and the resistance of Thermistor according to Ohms Law. Finally, it calculates the temperature sensed by the Thermistor, according to the formula.

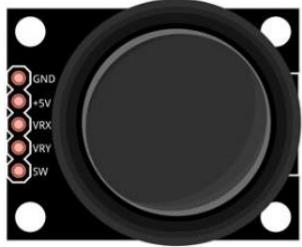

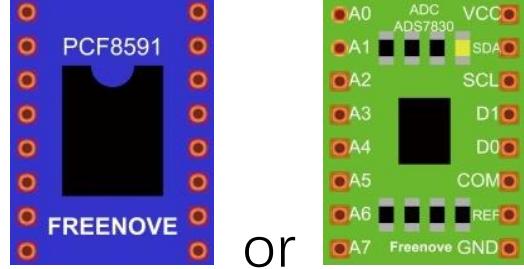

# Chapter 12 Joystick

In an earlier chapter, we learned how to use Rotary Potentiometer. We will now learn about joysticks, which are electronic modules that work on the same principle as the Rotary Potentiometer.

## Project 12.1 Joystick

In this project, we will read the output data of a joystick and display it to the Terminal screen.

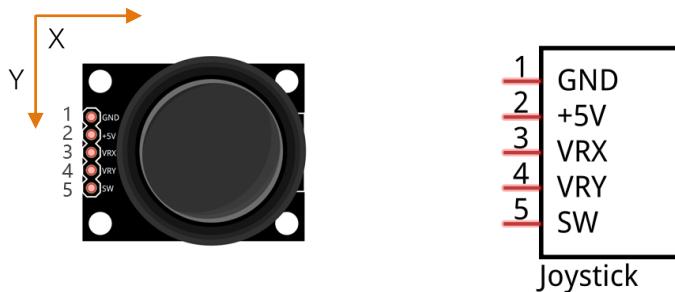

## Component List

Raspberry Pi x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Jumper x18 
Joystick x1 	ADC module x1 Or  Resistor 10kΩ x3 

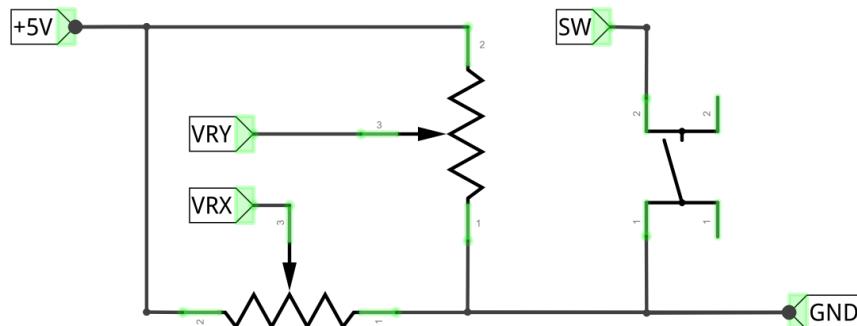

## Component knowledge

### Joystick

A Joystick is a kind of input sensor used with your fingers. You should be familiar with this concept already as they are widely used in gamepads and remote controls. It can receive input on two axes (Y and or X) at the same time (usually used to control direction on a two dimensional plane). And it also has a third direction capability by **pressing down (Z axis/direction)**.

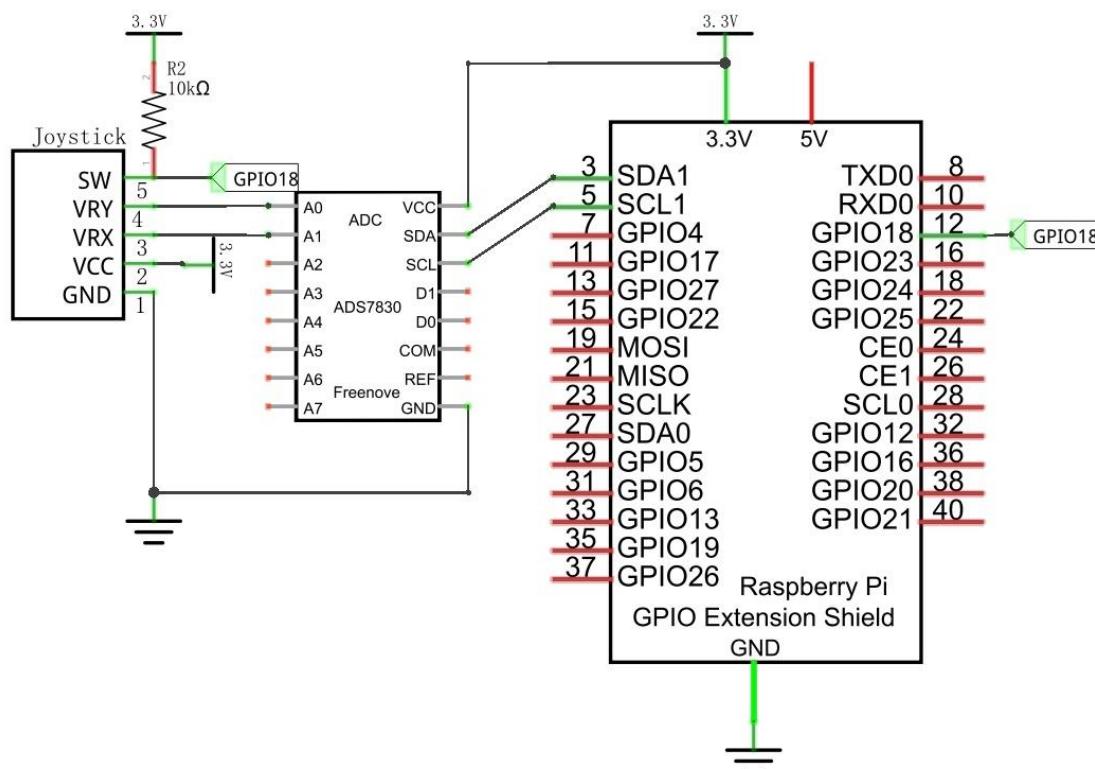

This is accomplished by incorporating two rotary potentiometers inside the Joystick Module at 90 degrees of each other, placed in such a manner as to detect shifts in direction in two directions simultaneously and with a Push Button Switch in the “vertical” axis, which can detect when a User presses on the Joystick.

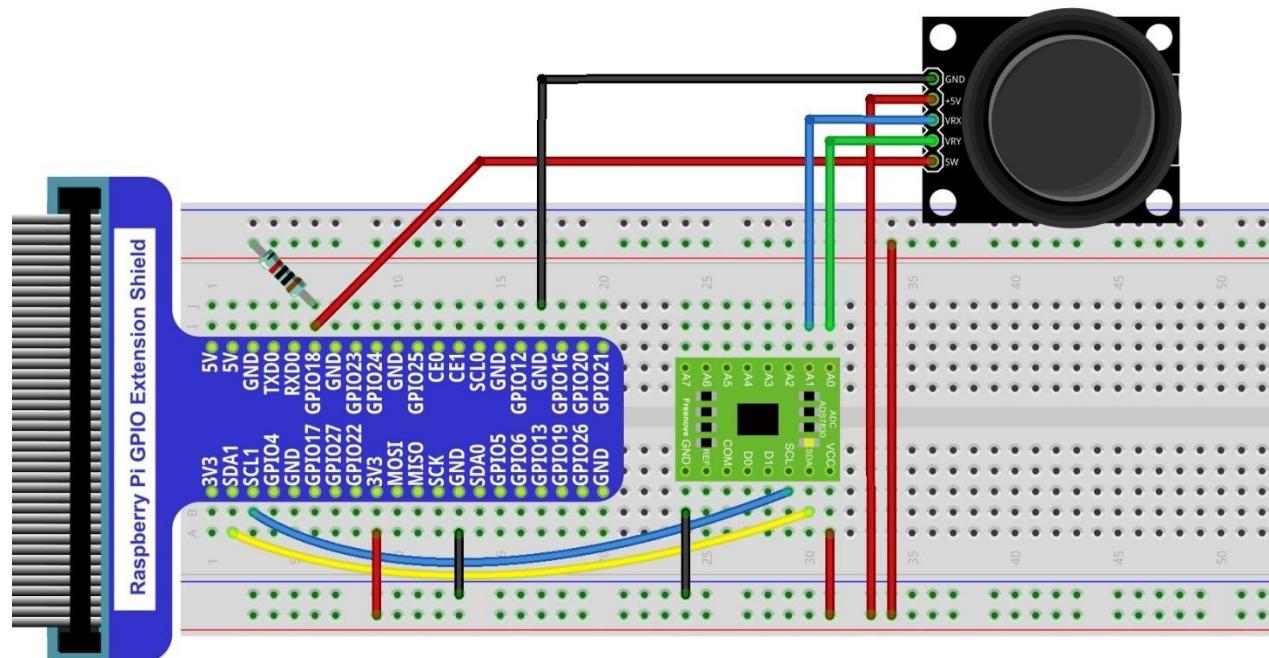

When the Joystick data is read, there are some differences between the axes: data of X and Y axes is analog, which needs to use the ADC. The data of the Z axis is digital, so you can directly use the GPIO to read this data or you have the option to use the ADC to read this.

## Circuit with ADS7830

Schematic diagram

Video: <https://youtu.be/qjP3HpbPJTM>

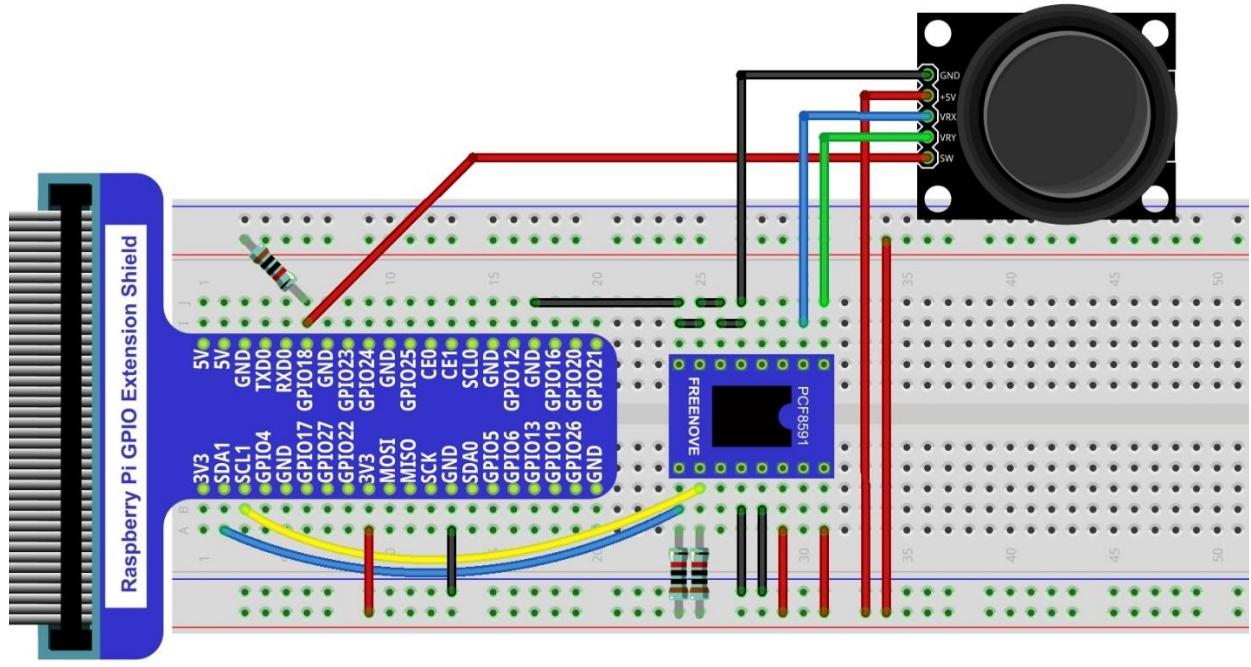

## Circuit with PCF8591

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

In this project's code, we will read the ADC values of X and Y axes of the Joystick, and read digital quality of the Z axis, then display these out in Terminal.

### C Code 12.1.1 Joystick

If you did not [configure I2C](#), please refer to [Chapter 7](#). If you did, please continue.

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 12.1.1\_Joystick directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/12.1.1_Joystick
```

2. Use following command to compile "Joystick.cpp" and generate executable file "Joystick".

```
g++ Joystick.cpp -o Joystick -lwiringPi -IADCDevice
```

3. Then run the generated file "Joystick".

```
sudo ./Joystick
```

After the program is executed, the terminal window will display the data of 3 axes X, Y and Z. Shifting (moving) the Joystick or pressing it down will make the data change.

```
val_X: 128 , val_Y: 135 , val_Z: 1
val_X: 128 , val_Y: 155 , val_Z: 1
val_X: 255 , val_Y: 255 , val_Z: 1
val_X: 181 , val_Y: 255 , val_Z: 1
val_X: 128 , val_Y: 255 , val_Z: 1
val_X: 128 , val_Y: 180 , val_Z: 0
val_X: 128 , val_Y: 138 , val_Z: 0
val_X: 128 , val_Y: 137 , val_Z: 0
val_X: 128 , val_Y: 139 , val_Z: 0
val_X: 128 , val_Y: 139 , val_Z: 1
```

The flowing is the code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <softPwm.h>
4 #include <ADCDevice.hpp>
5
6 #define Z_Pin 1      //define pin for axis Z
7
8 ADCDevice *adc; // Define an ADC Device class object
9
10 int main(void){
11     adc = new ADCDevice();
12     printf("Program is starting ... \n");
13 }
```

```

14     if(adc->detectI2C(0x48)){    // Detect the pcf8591.
15         delete adc;           // Free previously pointed memory
16         adc = new PCF8591();   // If detected, create an instance of PCF8591.
17     }
18     else if(adc->detectI2C(0x4b)){// Detect the ads7830
19         delete adc;           // Free previously pointed memory
20         adc = new ADS7830();   // If detected, create an instance of ADS7830.
21     }
22     else{
23         printf("No correct I2C address found, \n"
24             "Please use command 'i2cdetect -y 1' to check the I2C address! \n"
25             "Program Exit. \n");
26         return -1;
27     }
28     wiringPiSetup();
29     pinMode(Z_Pin, INPUT);      //set Z_Pin as input pin and pull-up mode
30     pullUpDnControl(Z_Pin, PUD_UP);
31     while(1){
32         int val_Z = digitalRead(Z_Pin); //read digital value of axis Z
33         int val_Y = adc->analogRead(0); //read analog value of axis X and Y
34         int val_X = adc->analogRead(1);
35         printf("val_X: %d ,\tval_Y: %d ,\tval_Z: %d \n",val_X,val_Y,val_Z);
36         delay(100);
37     }
38     return 0;
39 }
```

In the code, configure Z\_Pin to pull-up input mode. In the while loop of the main function, use **analogRead()** to read the value of axes X and Y and use **digitalRead()** to read the value of axis Z, then display them.

```

while(1){
    int val_Z = digitalRead(Z_Pin); //read digital value of axis Z
    int val_Y = adc->analogRead(0); //read analog value of axis X and Y
    int val_X = adc->analogRead(1);
    printf("val_X: %d ,\tval_Y: %d ,\tval_Z: %d \n",val_X,val_Y,val_Z);
    delay(100);
}
```

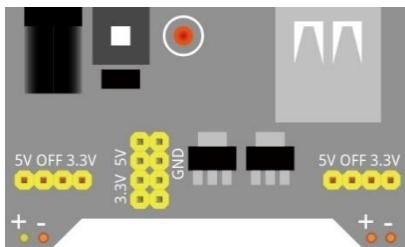

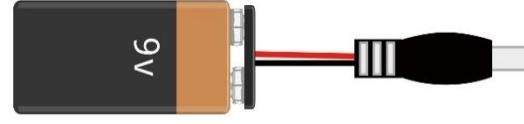

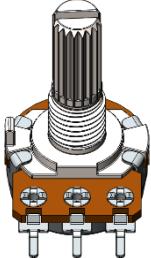

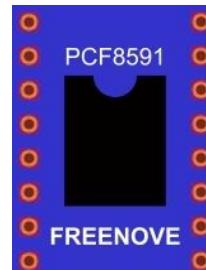

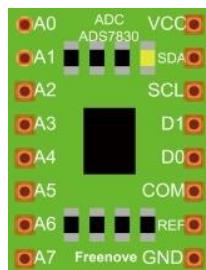

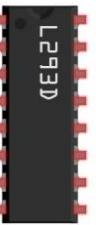

# Chapter 13 Motor & Driver

In this chapter, we will learn about DC Motors and DC Motor Drivers and how to control the speed and direction of a DC Motor.

## Project 13.1 Control a DC Motor with a Potentiometer

In this project, a potentiometer will be used to control a DC Motor. When the Potentiometer is at the midpoint position, the DC Motor will STOP, and when the Potentiometer is turned in either direction of this midpoint, the DC Motor speed increases until it reached the endpoint where the DC Motor achieves its maximum speed. When the Potentiometer is turned “Left” of the midpoint the DC Motor will ROTATE in one direction and when turned “Right” the DC Motor will ROTATE in the opposite direction.

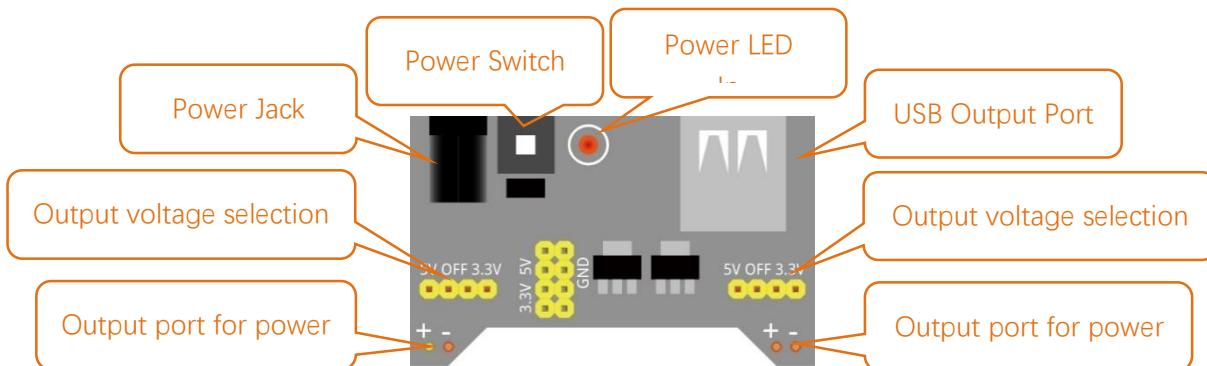

## Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Jumper Wires x23 			
Breadboard Power Module x1 	9V Battery (you provide) & 9V Battery Cable 			
Rotary Potentiometer x1 	DC Motor x1 	10kΩ x2 	ADC Module x1  Or 	L293D IC Chip 

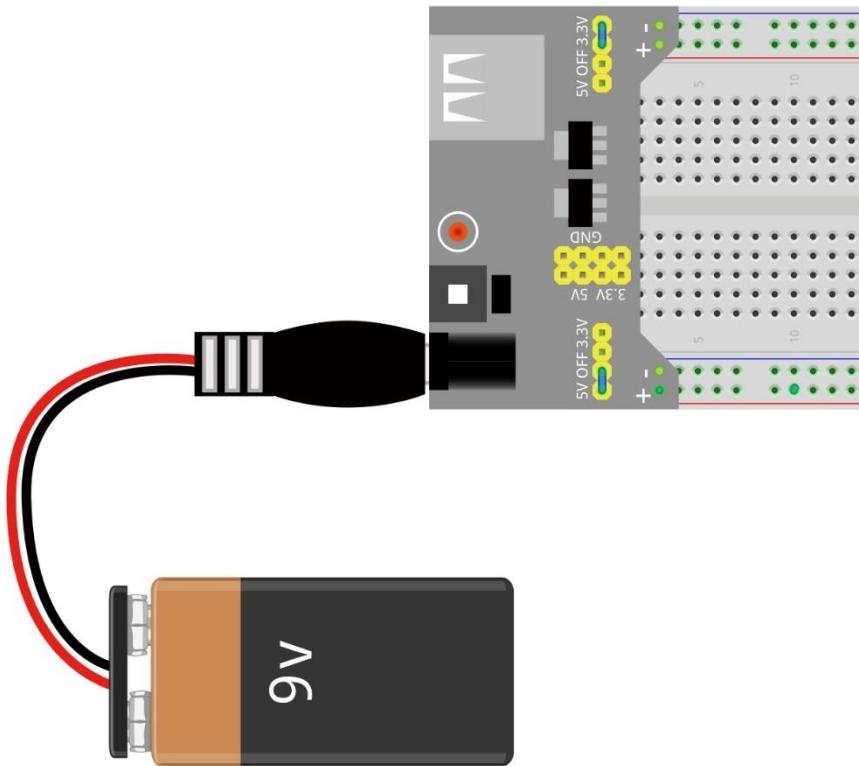

## Component knowledge

### Breadboard Power Module

Breadboard Power Module is an independent circuit board, which can provide independent 5V or 3.3V power to the breadboard when building circuits. It also has built-in power protection to avoid damaging your RPi module. The schematic diagram below identifies the important features of this Power Module:

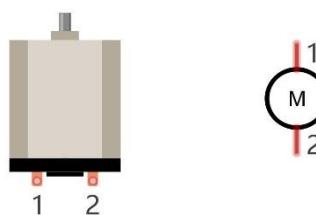

Here is an acceptable connection between Breadboard Power Module and Breadboard using a 9V battery and the provided power harness:

## DC Motor

DC Motor is a device that converts electrical energy into mechanical energy. DC Motors consist of two major parts, a Stator and the Rotor. The stationary part of a DC Motor is the Stator and the part that Rotates is the Rotor. The Stator is usually part of the outer case of motor (if it is simply a pair of permanent magnets), and it has terminals to connect to the power if it is made up of electromagnet coils. Most Hobby DC Motors only use Permanent Magnets for the Stator Field. The Rotor is usually the shaft of motor with 3 or more electromagnets connected to a commutator where the brushes (via the terminals 1 & 2 below) supply electrical power, which can drive other mechanical devices. The diagram below shows a small DC Motor with two terminal pins.

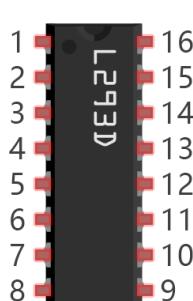

When a DC Motor is connected to a power supply, it will rotate in one direction. If you reverse the polarity of the power supply, the DC Motor will rotate in opposite direction. This is important to note.

## L293D

L293D is an IC Chip (Integrated Circuit Chip) with a 4-channel motor drive. You can drive a Unidirectional DC Motor with 4 ports or a Bi-Directional DC Motor with 2 ports or a Stepper Motor (Stepper Motors are covered later in this Tutorial).

1	Enable 1	+V	16
2	In 1	In 4	15
3	Out 1	Out 4	14
4	0V	0V	13
5	0V	0V	12
6	Out 2	Out 3	11
7	In 2	In 3	10
8	+Vmotor	Enable 2	9

L293D

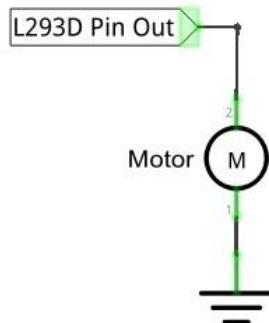

Port description of L293D module is as follows:

Pin name	Pin number	Description
In x	2, 7, 10, 15	Channel x digital signal input pin
Out x	3, 6, 11, 14	Channel x output pin, input high or low level according to In x pin, gets connected to +Vmotor or 0V
Enable1	1	Channel 1 and Channel 2 enable pin, high level enable
Enable2	9	Channel 3 and Channel 4 enable pin, high level enable
0V	4, 5, 12, 13	Power Cathode (GND)
+V	16	Positive Electrode (VCC) of power supply, supply voltage 4.5~36V
+Vmotor	8	Positive Electrode of load power supply, provide power supply for the Out pin x, the supply voltage is +V~36V

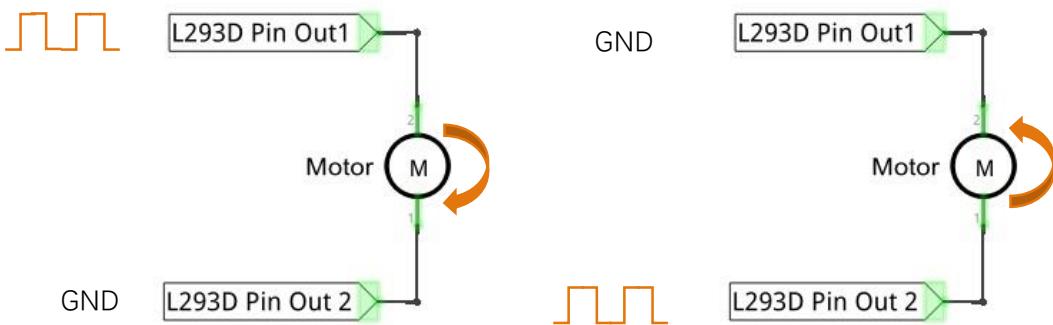

For more details, please see the datasheet for this IC Chip.

When using the L293D to drive a DC Motor, there are usually two connection options.

The following connection option uses one channel of the L293D, which can control motor speed through the PWM, However the motor then can only rotate in one direction.

The following connection uses two channels of the L293D: one channel outputs the PWM wave, and the other channel connects to GND. Therefore, you can control the speed of the motor. When these two channel signals are exchanged, not only controls the speed of motor, but also can control the direction of the motor.

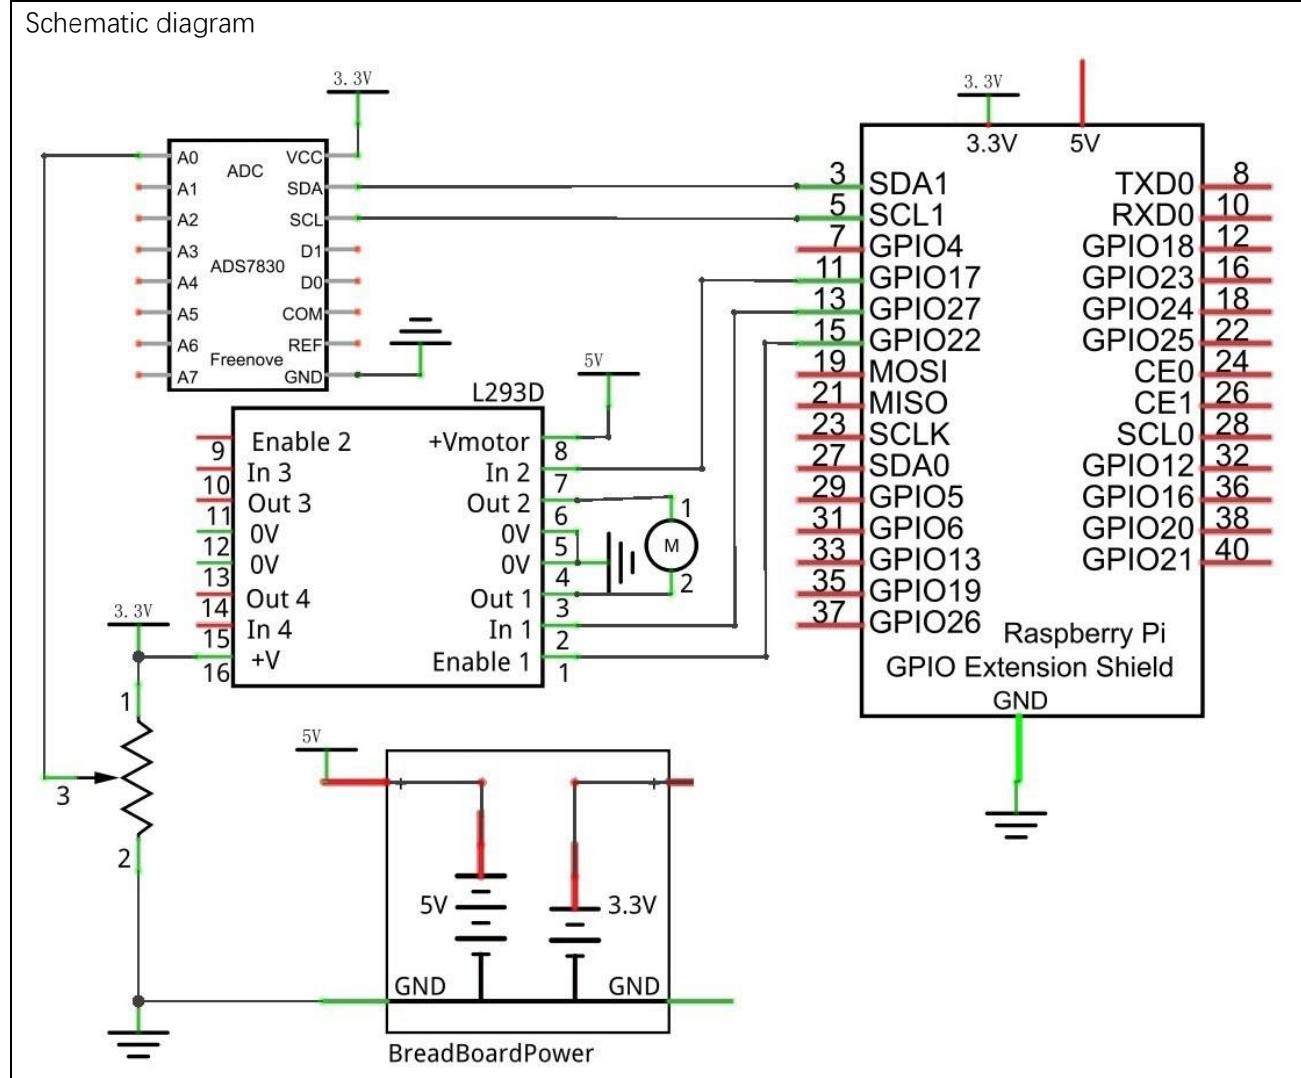

In practical use the motor is usually connected to channel 1 and by outputting different levels to in1 and in2 to control the rotational direction of the motor, and output to the PWM wave to Enable1 port to control the motor's rotational speed. If the motor is connected to channel 3 and 4 by outputting different levels to in3 and in4 to control the motor's rotation direction, and output to the PWM wave to Enable2 pin to control the motor's rotational speed.

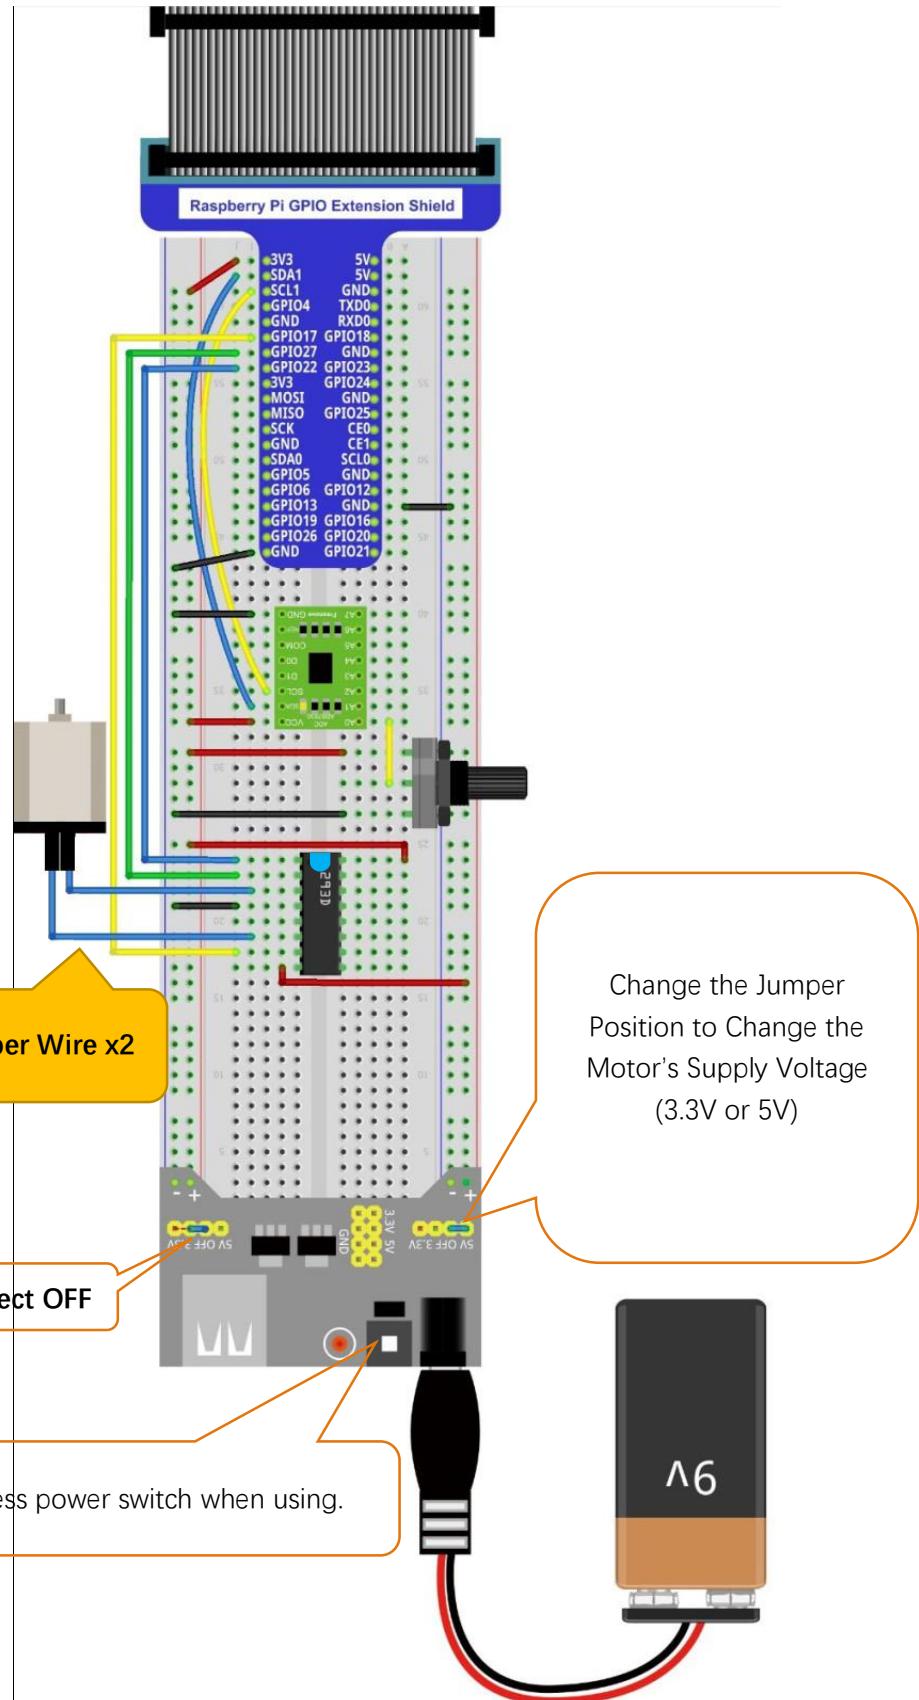

## Circuit with ADS7830

Use caution when connecting this circuit because the DC Motor is a high-power component. **Do not use the power provided by the RPi to power the motor directly, as this may cause permanent damage to your RPi!** The logic circuit can be powered by the RPi's power or an external power supply, which should share a common ground with RPi.

Schematic diagram

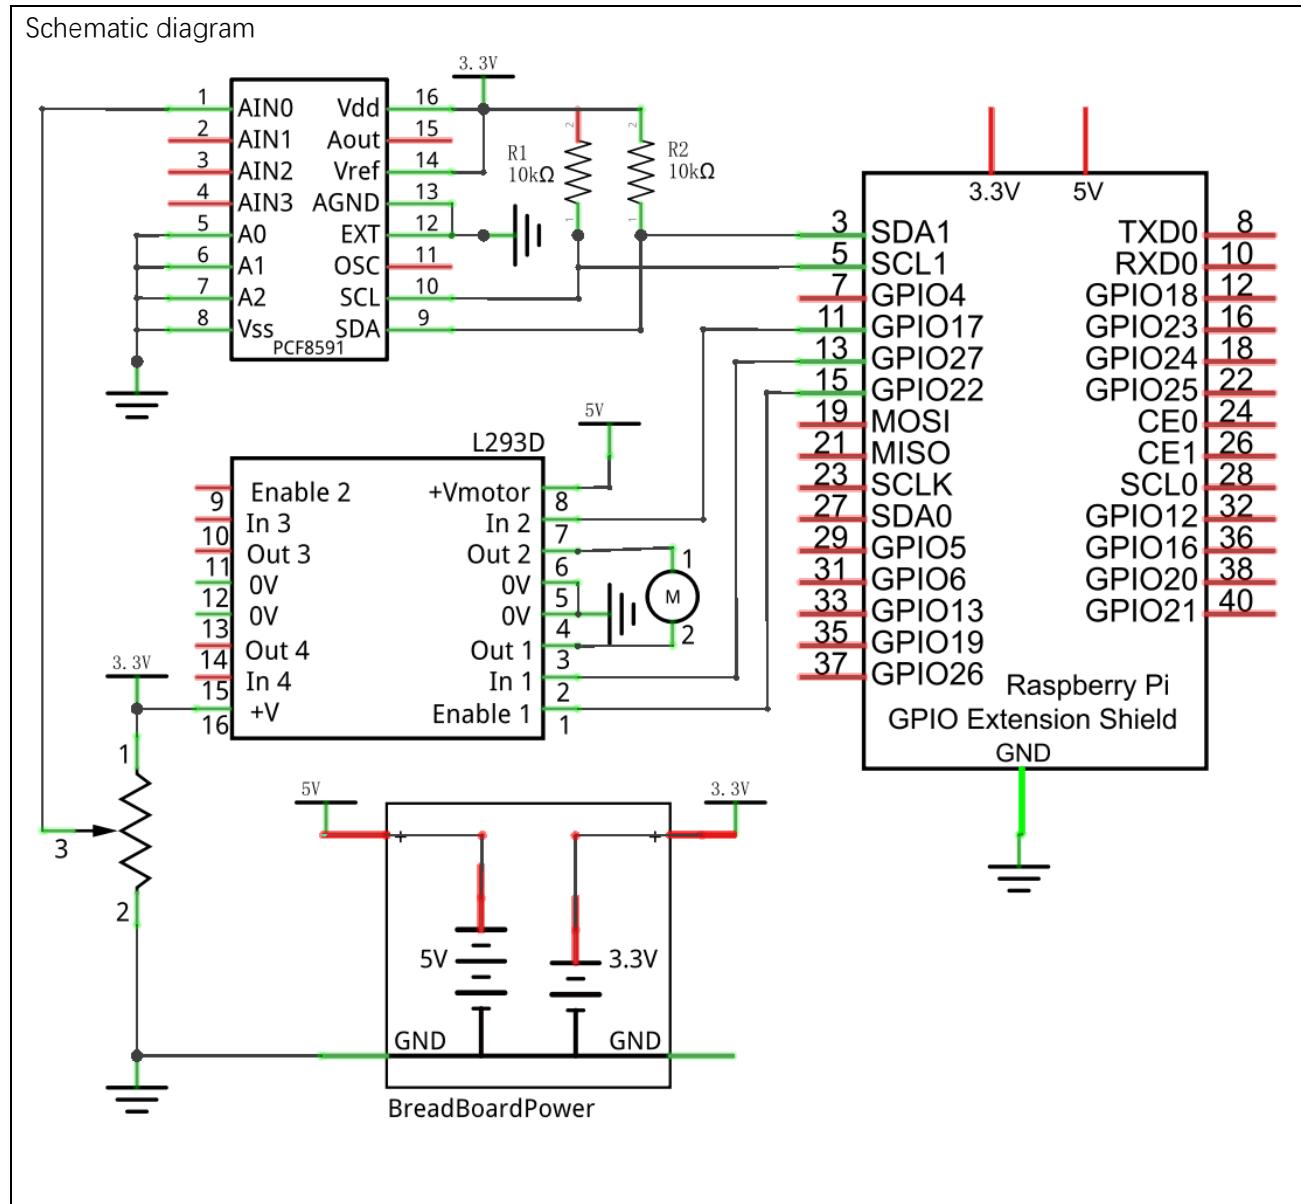

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

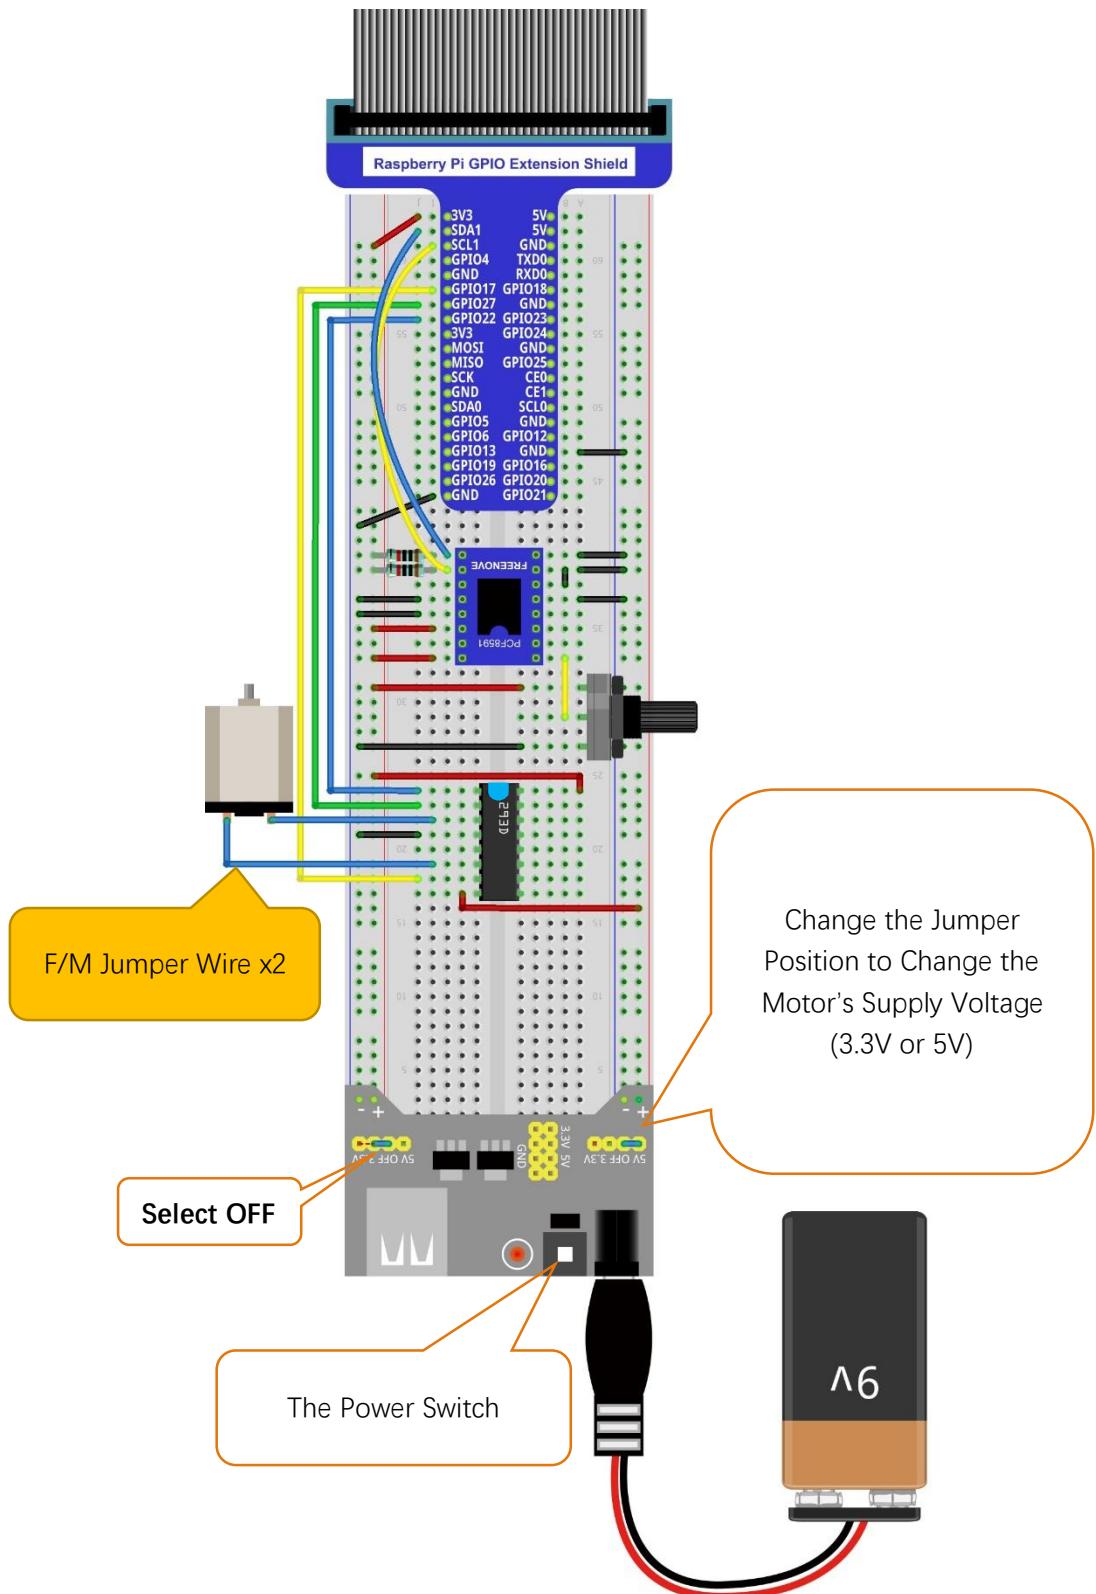

Video: <https://youtu.be/d5IRMTDK-wg>

## Code

In code for this project, first read the ADC value and then control the rotation direction and speed of the DC Motor according to the value of the ADC.

### C Code 13.1.1 Motor

If you did not [configure I2C](#), please refer to [Chapter 7](#). If you did, please continue.

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 13.1.1\_Motor directory of the C code.

```
cd ~/Freenove_Kit/Code/C_Code/13.1.1_Motor
```

2. Use the following command to compile "Motor.cpp" and generate the executable file "Motor".

```
g++ Motor.cpp -o Motor -lwiringPi -IADCDevice
```

3. Then run the generated file "Motor".

```
sudo ./Motor
```

After the program is executed, you can use the Potentiometer to control the DC Motor. When the Potentiometer is at the midpoint position, the DC Motor will STOP, and when the Potentiometer is turned in either direction of this midpoint, the DC Motor speed increases until it reaches the endpoint where the DC Motor achieves its maximum speed. When the Potentiometer is turned "Left" of the midpoint the DC Motor will ROTATE in one direction and when turned "Right" the DC Motor will ROTATE in the opposite direction. You will also see the ADC value of the potentiometer displayed in the Terminal with the motor direction and the PWM duty cycle used to control the DC Motor's speed.

```
turn Forward...
The PWM duty cycle is 66%
ADC value : 212
turn Forward...
The PWM duty cycle is 66%
ADC value : 212
turn Forward...
The PWM duty cycle is 66%
ADC value : 212
turn Forward...
The PWM duty cycle is 66%
ADC value : 212
turn Forward...
The PWM duty cycle is 66%
ADC value : 212
turn Forward...
The PWM duty cycle is 66%
ADC value : 212
turn Forward...
```

The following is the code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <softPwm.h>
4 #include <math.h>
5 #include <stdlib.h>
6 #include <ADCDevice.hpp>
7
```

```
8 #define motorPin1    2      //define the pin connected to L293D
9 #define motorPin2    0
10#define enablePin     3
11
12ADCDevice *adc; // Define an ADC Device class object
13
14//Map function: map the value from a range to another range.
15long map(long value, long fromLow, long fromHigh, long toLow, long toHigh) {
16    return (toHigh-toLow)*(value-fromLow) / (fromHigh-fromLow) + toLow;
17}
18//motor function: determine the direction and speed of the motor according to the ADC
19void motor(int ADC) {
20    int value = ADC -128;
21    if(value>0) {
22        digitalWrite(motorPin1,HIGH);
23        digitalWrite(motorPin2,LOW);
24        printf("turn Forward...\n");
25    }
26    else if (value<0) {
27        digitalWrite(motorPin1,LOW);
28        digitalWrite(motorPin2,HIGH);
29        printf("turn Back...\n");
30    }
31    else {
32        digitalWrite(motorPin1,LOW);
33        digitalWrite(motorPin2,LOW);
34        printf("Motor Stop...\n");
35    }
36    softPwmWrite(enablePin, map(abs(value), 0, 128, 0, 100));
37    printf("The PWM duty cycle is %d%%\n", abs(value)*100/127); //print the PMW duty cycle
38}
39int main(void){
40    adc = new ADCDevice();
41    printf("Program is starting ... \n");
42
43    if(adc->detectI2C(0x48)){ // Detect the pcf8591.
44        delete adc;           // Free previously pointed memory
45        adc = new PCF8591(); // If detected, create an instance of PCF8591.
46    }
47    else if(adc->detectI2C(0x4b)){// Detect the ads7830
48        delete adc;           // Free previously pointed memory
49        adc = new ADS7830(); // If detected, create an instance of ADS7830.
50    }
51    else{
```

```

52     printf("No correct I2C address found, \n"
53     "Please use command 'i2cdetect -y 1' to check the I2C address! \n"
54     "Program Exit. \n");
55     return -1;
56 }
57 wiringPiSetup();
58 pinMode(enablePin,OUTPUT);//set mode for the pin
59 pinMode(motorPin1,OUTPUT);
60 pinMode(motorPin2,OUTPUT);
61 softPwmCreate(enablePin,0,100);//define PWM pin
62 while(1){
63     int value = adc->analogRead(0); //read analog value of A0 pin
64     printf("ADC value : %d \n",value);
65     motor(value); //make the motor rotate with speed(analog value of A0 pin)
66     delay(100);
67 }
68 return 0;
69 }
```

Now that we have familiarity with reading ADC values, let's learn the subfunction void motor (int ADC): first, compare the ADC value with 128 (value corresponding to midpoint). When the current ADC value is higher, motoRPin1 outputs high level and motoRPin2 outputs low level to control the DC Motor to run in the "Forward" Rotational Direction. When the current ADC value is lower, motoRPin1 outputs low level and motoRPin2 outputs high level to control the DC Motor to run in the "Reverse" Rotational Direction. When the ADC value is equal to 128, motoRPin1 and motoRPin2 output low level, the motor STOPS. Then determine the PWM duty cycle according to the difference (delta) between ADC value and 128. Because the absolute delta value stays within 0-128, we need to use the map() subfunction mapping the delta value to a range of 0-255. Finally, we see a display of the duty cycle in Terminal.

```

void motor(int ADC) {
    int value = ADC -128;
    if(value>0) {
        digitalWrite(motoRPin1,HIGH);
        digitalWrite(motoRPin2,LOW);
        printf("turn Forward... \n");
    }
    else if (value<0) {
        digitalWrite(motoRPin1,LOW);
        digitalWrite(motoRPin2,HIGH);
        printf("turn Backward... \n");
    }
    else {
        digitalWrite(motoRPin1,LOW);
        digitalWrite(motoRPin2,LOW);
        printf("Motor Stop... \n");
    }
}
```

```
    }
    softPwmWrite(enablePin, map(abs(value), 0, 128, 0, 100));
    printf("The PWM duty cycle is %d%%\n", abs(value)*100/127); // print out PWM duty cycle.
}
```

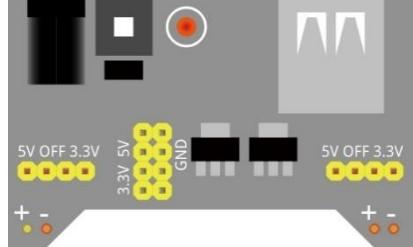

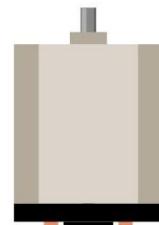

# Chapter 14 Relay & Motor

In this chapter, we will learn a kind of special switch module, Relay Module.

## Project 14.1.1 Relay & Motor

In this project, we will use a Push Button Switch indirectly to control the DC Motor via a Relay.

### Component List

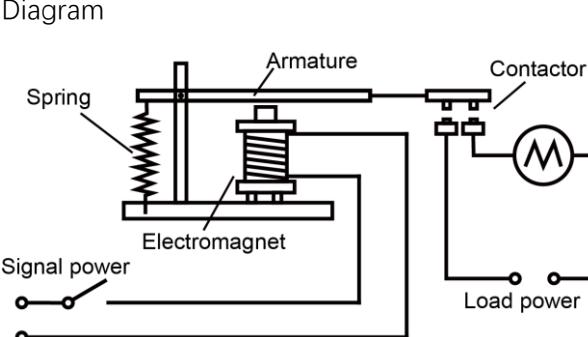

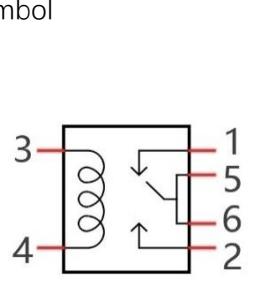

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper Wire x11 				
9V battery (prepared by yourself) & battery line 					
Breadboard Power module x1 	Resistor 10kΩ x2 	Resistor 1kΩ x1 	Resistor 220Ω x1 		
NPN transistor x1 	Relay x1 	Motor x1 	Push button x1 	LED x1 	Diode x1 

## Component knowledge

### Relay

Relays are a type of Switch that open and close circuits electromechanically or electronically. Relays control one electrical circuit by opening and closing contacts in another circuit using an electromagnet to initiate the Switch action. When the electromagnet is energized (powered), it will attract internal contacts completing a circuit, which act as a Switch. Many times Relays are used to allow a low powered circuit (and a small low amperage switch) to safely turn ON a larger more powerful circuit. They are commonly found in automobiles, especially from the ignition to the starter motor.

The following is a basic diagram of a common Relay and the image and circuit symbol diagram of the 5V relay used in this project:

Diagram	Feature:	Symbol
		

Pin 5 and pin 6 are internally connected to each other. When the coil pin 3 and pin 4 are connected to a 5V power supply, pin 1 will be disconnected from pins 5 & 6 and pin 2 will be connected to pins 5 & 6. Pin 1 is called Closed End and pin 2 is called the Open End.

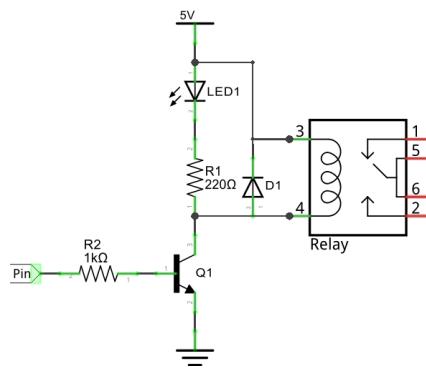

### Inductor

The symbol of Inductance is “L” and the unit of inductance is the “Henry” (H). Here is an example of how this can be encountered:  $1\text{H}=1000\text{mH}$ ,  $1\text{mH}=1000\mu\text{H}$ .

An Inductor is a passive device that stores energy in its Magnetic Field and returns energy to the circuit whenever required. An Inductor is formed by a Cylindrical Core with many Turns of conducting wire (usually copper wire). Inductors will hinder the changing current passing through it. When the current passing through the Inductor increases, it will attempt to hinder the increasing movement of current; and when the current passing through the inductor decreases, it will attempt to hinder the decreasing movement of current. So the current passing through an Inductor is not transient.

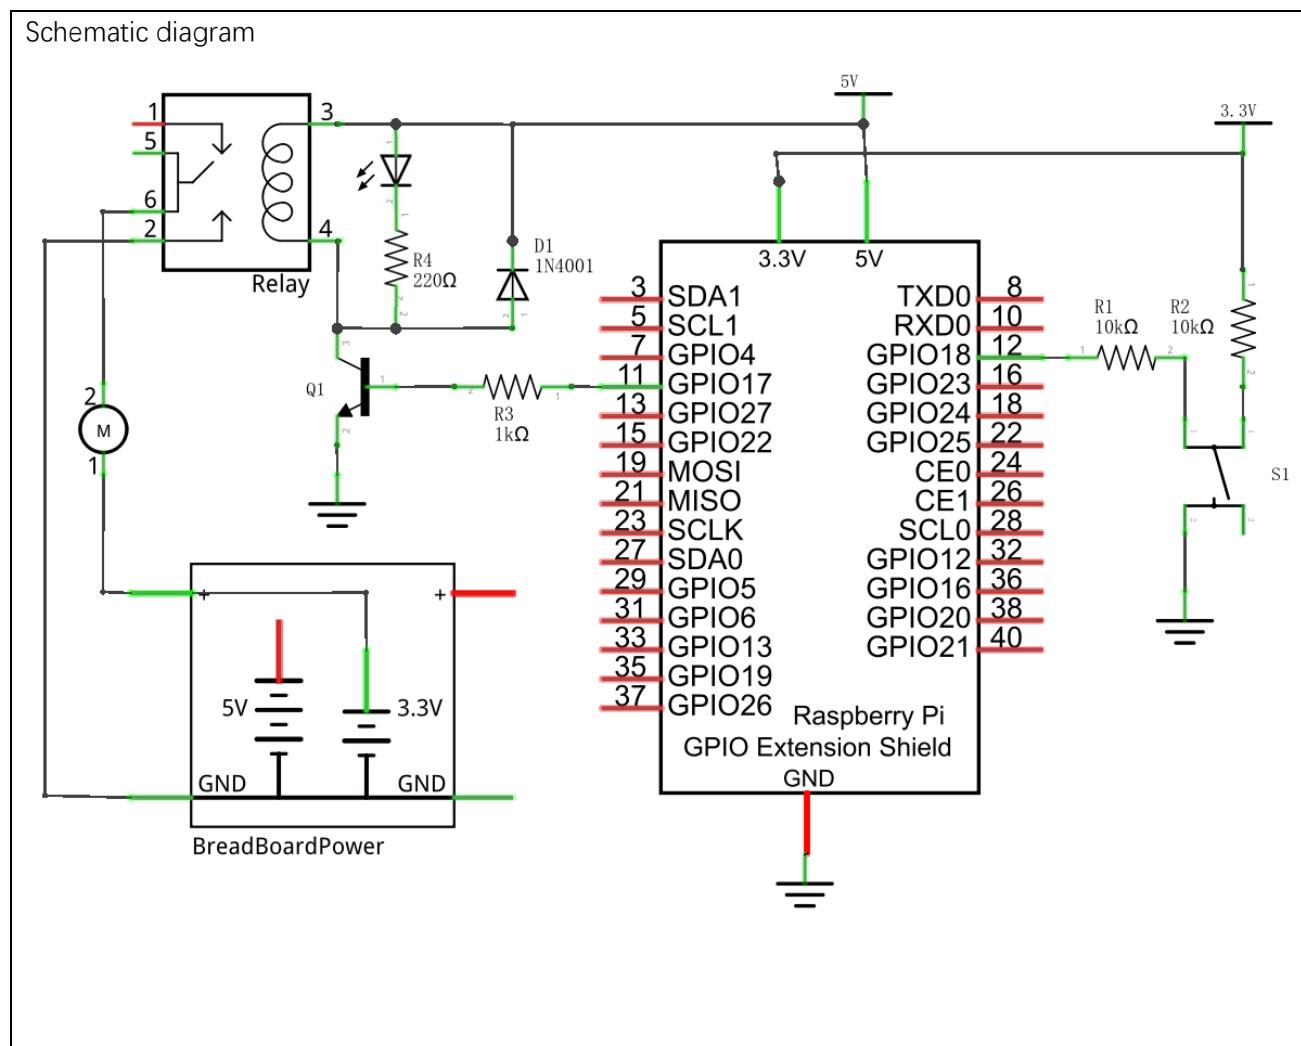

The circuit for a Relay is as follows: The coil of Relay can be equivalent to an Inductor, when a Transistor is present in this coil circuit it can disconnect the power to the relay, the current in the Relay's coil does not stop immediately, which affects the power supply adversely. To remedy this, diodes in parallel are placed on both ends of the Relay coil pins in opposite polar direction. Having the current pass through the diodes will avoid any adverse effect on the power supply.

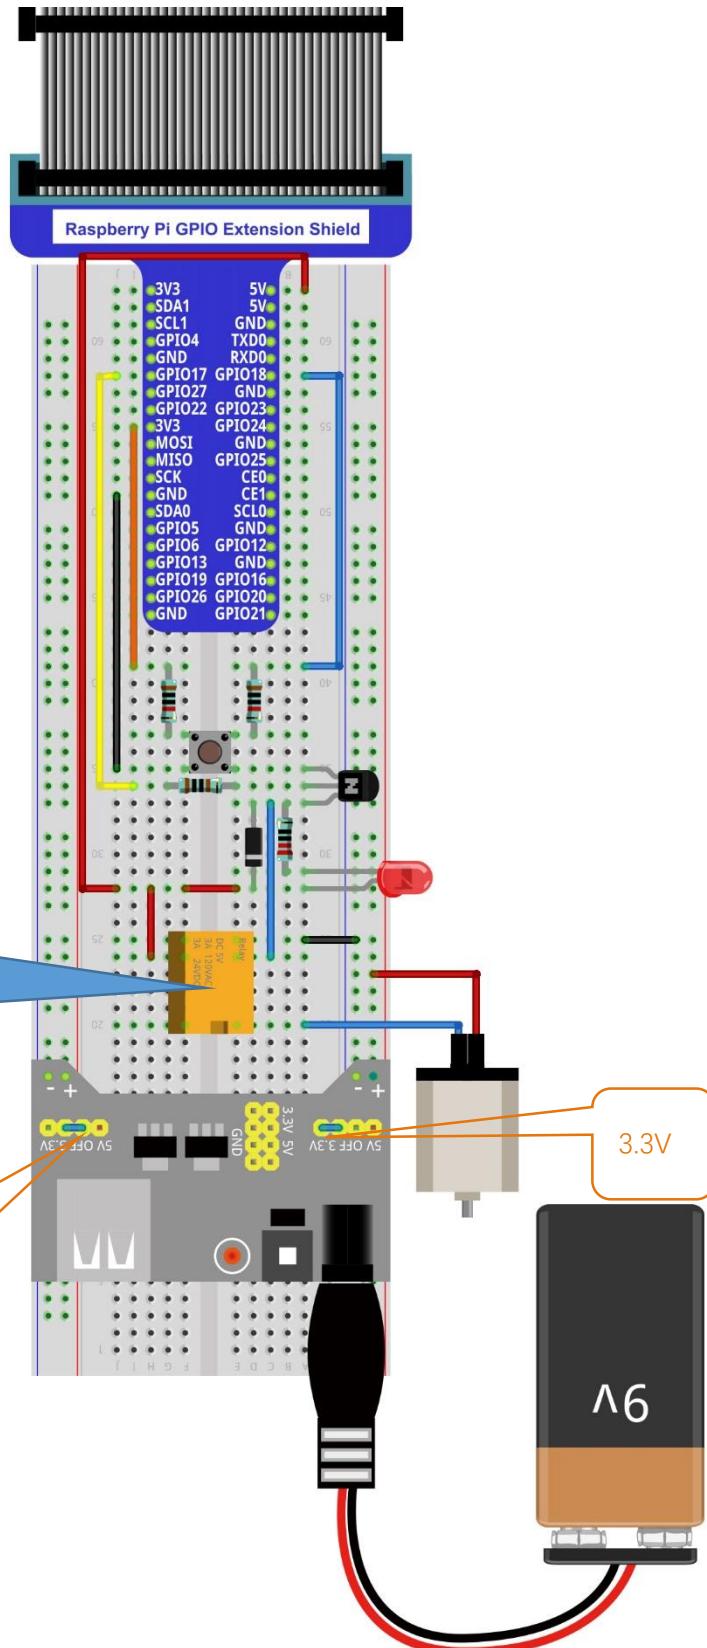

## Circuit

Use caution with the power supply voltage needed for the components in this circuit. The Relay requires a power supply voltage of 5V, and the DC Motor only requires 3.3V. Additionally, there is an LED present, which acts as an indicator (ON or OFF) for the status of the Relay's active status.

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

Video: <https://youtu.be/CUpPpWq8YI8>

## Code

The project code is in the same as we used earlier in the Table Lamp project. Pressing the Push Button Switch activates the transistor. Because the Relay and the LED are connected in parallel, they will be powered ON at the same time. Press the Push Button Switch again will turn them both OFF.

### C Code 14.1.1 Relay

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: support@freenove.com

1. Use cd command to enter 14.1.1\_Relay directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/14.1.1_Relay
```

2. Use following command to compile "Relay.c" and generate executable file "Relay".

```
gcc Relay.c -o Relay -lwiringPi
```

3. Run the generated file "Relay".

```
sudo ./Relay
```

After the program is executed, pressing the Push Button Switch activates the Relay (the internal switch is closed), which powers the DC Motor to rotate and simultaneously powers the LED to turn ON. If you press the Push Button Switch again, the Relay is deactivated (the internal switch opens), the Motor STOPS and the LED turns OFF.

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3
4 #define relayPin 0 //define the relayPin
5 #define buttonPin 1 //define the buttonPin
6 int relayState=LOW; //store the State of relay
7 int buttonState=HIGH; //store the State of button
8 int lastbuttonState=HIGH;//store the lastState of button
9 long lastChangeTime; //store the change time of button state
10 long captureTime=50; //set the button state stable time
11 int reading;
12 int main(void)
13 {
14     printf("Program is starting...\n");
15
16     wiringPiSetup();
17
18     pinMode(relayPin, OUTPUT);
19     pinMode(buttonPin, INPUT);
20     pullUpDnControl(buttonPin, PUD_UP); //pull up to high level
21     while(1) {
22         reading = digitalRead(buttonPin); //read the current state of button
23         if( reading != lastbuttonState){ //if the button state changed ,record the time
point
```

```
24         lastChangeTime = millis();
25     }
26     //if changing-state of the button last beyond the time we set, we considered that
27     //the current button state is an effective change rather than a buffeting
28     if(millis() - lastChangeTime > captureTime){
29         //if button state is changed, update the data.
30         if(reading != buttonState){
31             buttonState = reading;
32             //if the state is low, the action is pressing.
33             if(buttonState == LOW){
34                 printf("Button is pressed!\n");
35                 relayState = !relayState;
36                 if(relayState){
37                     printf("turn on relay ... \n");
38                 }
39                 else {
340                     printf("turn off relay ... \n");
341                 }
342             }
343             //if the state is high, the action is releasing.
344             else {
345                 printf("Button is released!\n");
346             }
347         }
348     }
349     digitalWrite(relayPin, relayState);
350     lastbuttonState = reading;
351 }
352
353     return 0;
354 }
```

The project code is in the same as we used earlier in the Table Lamp project.

# Chapter 15 Servo

Previously, we learned how to control the speed and rotational direction of a DC Motor. In this chapter, we will learn about Servos which are a rotary actuator type motor that can be controlled rotate to specific angles.

## Project 15.1 Servo Sweep

First, we need to learn how to make a Servo rotate.

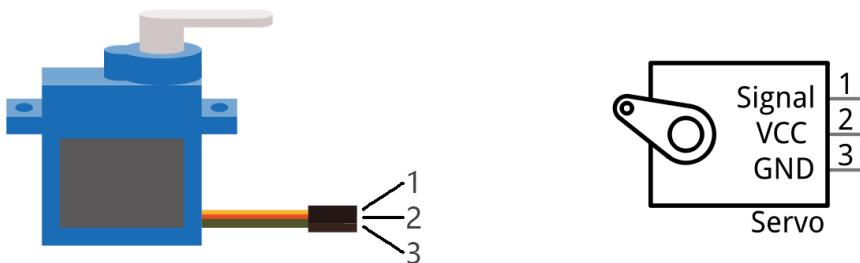

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper Wire x3
Servo x1	

## Component knowledge

### Servo

Servo is a compact package which consists of a DC Motor, a set of reduction gears to provide torque, a sensor and control circuit board. Most Servos only have a 180-degree range of motion via their "horn". Servos can output higher torque than a simple DC Motor alone and they are widely used to control motion in model cars, model airplanes, robots, etc. Servos have three wire leads which usually terminate to a male or female 3-pin plug. Two leads are for electric power: Positive (2-VCC, Red wire), Negative (3-GND, Brown wire), and the signal line (1-Signal, Orange wire) as represented in the Servo provided in your Kit.

We will use a 50Hz PWM signal with a duty cycle in a certain range to drive the Servo. The lasting time 0.5ms-2.5ms of PWM single cycle high level corresponds to the Servo angle 0 degrees - 180 degree linearly. Part of the corresponding values are as follows:

Note: the lasting time of high level corresponding to the servo angle is absolute instead of accumulating. For example, the high level time lasting for 0.5ms correspond to the 0 degree of the servo. If the high level time lasts for another 1ms, the servo rotates to 45 degrees.

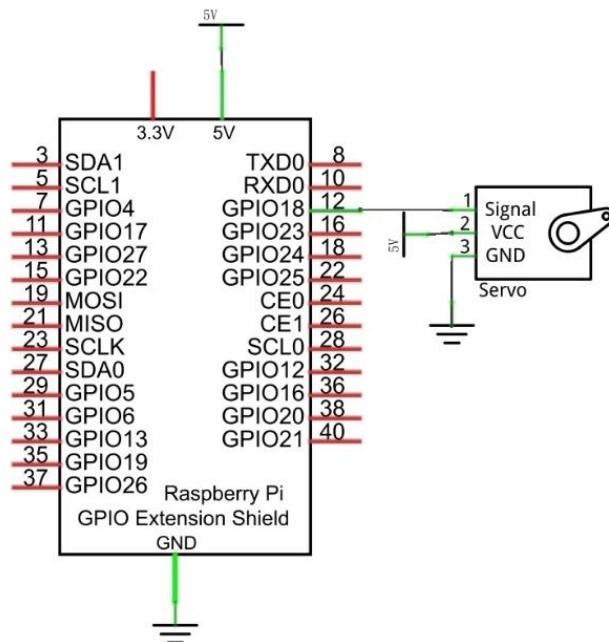

High level time	Servo angle
0.5ms	0 degree
1ms	45 degree
1.5ms	90 degree
2ms	135 degree
2.5ms	180 degree

When you change the Servo signal value, the Servo will rotate to the designated angle.

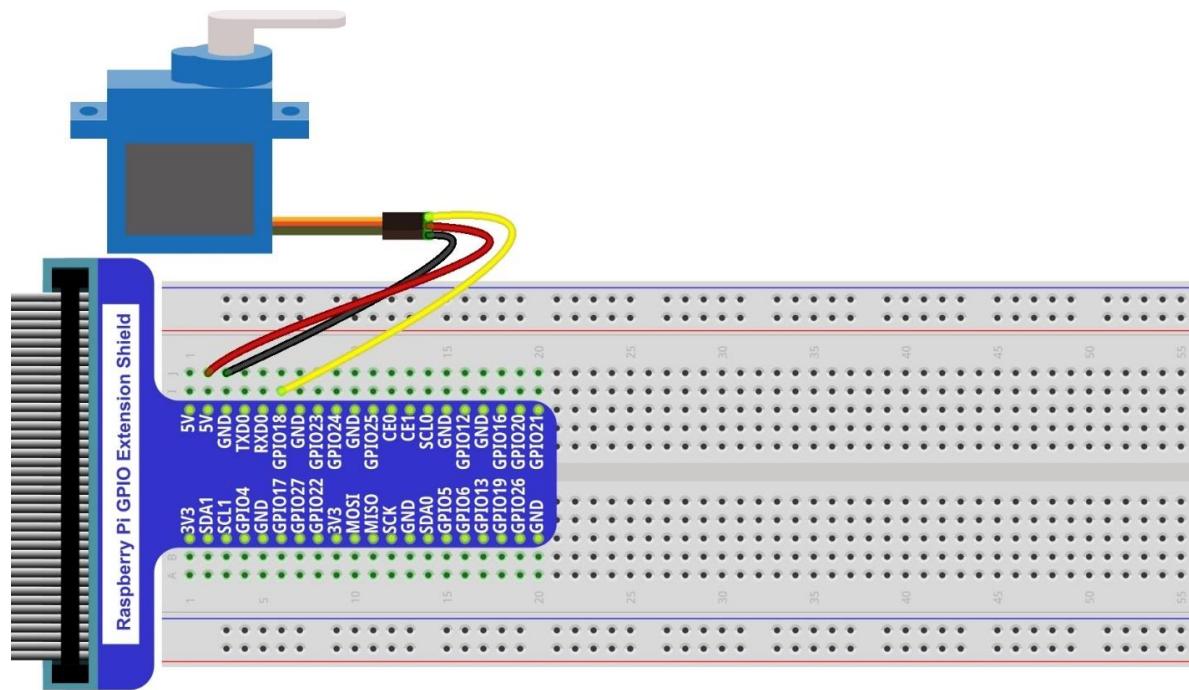

## Circuit

Use caution when supplying power to the Servo it should be 5V. Make sure you do not make any errors when connecting the Servo to the power supply.

Schematic diagram

[Video: <https://youtu.be/leptbJh32ZI>](https://youtu.be/leptbJh32ZI)

Sorry latter chapters don't have videos yet.

## Code

In this project, we will make a Servo rotate from 0 degrees to 180 degrees and then reverse the direction to make it rotate from 180 degrees to 0 degrees and repeat these actions in an endless loop.

### C Code 15.1.1 Sweep

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 15.1.1\_Sweep directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/15.1.1_Sweep
```

2. Use following command to compile "Sweep.c" and generate executable file "Sweep".

```
gcc Sweep.c -o Sweep -lwiringPi
```

3. Run the generated file "Sweep".

```
sudo ./Sweep
```

After the program is executed, the Servo will rotate from 0 degrees to 180 degrees and then reverse the direction to make it rotate from 180 degrees to 0 degrees and repeat these actions in an endless loop.

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <softPwm.h>
3 #include <stdio.h>
4 #define OFFSET_MS 3      //Define the unit of servo pulse offset: 0.1ms
5 #define SERVO_MIN_MS 5+OFFSET_MS          //define the pulse duration for minimum angle of servo
6 #define SERVO_MAX_MS 25+OFFSET_MS        //define the pulse duration for maximum angle of servo
7
8 #define servoPin    1      //define the GPIO number connected to servo
9 long map(long value, long fromLow, long fromHigh, long toLow, long toHigh) {
10     return (toHigh-toLow)*(value-fromLow) / (fromHigh-fromLow) + toLow;
11 }
12 void servoInit(int pin){           //initialization function for servo PMW pin
13     softPwmCreate(pin, 0, 200);
14 }
15 void servoWrite(int pin, int angle){ //Specify a certain rotation angle (0-180) for the
16     servo
17     if(angle > 180)
18         angle = 180;
19     if(angle < 0)
20         angle = 0;
21     softPwmWrite(pin, map(angle, 0, 180, SERVO_MIN_MS, SERVO_MAX_MS));
22 }
23 void servoWriteMS(int pin, int ms){ //specific the unit for pulse(5-25ms) with specific
24     duration output by servo pin: 0.1ms
25     if(ms > SERVO_MAX_MS)
26         ms = SERVO_MAX_MS;
27     if(ms < SERVO_MIN_MS)
```

```

26     ms = SERVO_MIN_MS;
27     softPwmWrite(pin,ms);
28 }
29
30 int main(void)
31 {
32     int i;
33
34     printf("Program is starting ... \n");
35
36     wiringPiSetup();
37     servoInit(servoPin);          //initialize PMW pin of servo
38     while(1){
39         for(i=SEROV_MIN_MS;i<SERVO_MAX_MS;i++) { //make servo rotate from minimum angle to
maximum angle
40             servoWriteMS(servoPin,i);
41             delay(10);
42         }
43         delay(500);
44         for(i=SEROV_MAX_MS;i>SEROV_MIN_MS;i--) { //make servo rotate from maximum angle to
minimum angle
45             servoWriteMS(servoPin,i);
46             delay(10);
47         }
48         delay(500);
49     }
50     return 0;
51 }
```

A 50 Hz pulse for a 20ms cycle is required to control the Servo. In function **softPwmCreate** (int pin, int initialValue, int pwmRange), the unit of the third parameter pwmRange is 100US, specifically 0.1ms. In order to get the PWM with a 20ms cycle, the pwmRange shoulde be set to 200. So in the subfunction of **servoInit()**, we create a PWM pin with a pwmRange of 200.

```

void servoInit(int pin){           //initialization function for servo PWM pin
    softPwmCreate(pin, 0, 200);
}
```

Since 0-180 degrees of the Servo's motion corresponds to the PWM pulse width of 0.5-2.5ms, with a PwmRange of 200 ms. We then need the function **softPwmWrite** (int pin, int value) and the scope 5-25 of the parameter values to correspond to 0-180 degrees' motion of the Servo. What's more, the number written in subfunction **servoWriteMS()** should be within the range of 5-25. However, in practice, due to the inherent error manufactured into each Servo, the pulse width will have a deviation. So we need to define a minimum and maximum pulse width and an error offset (this is essential in robotics).

```

#define OFFSET_MS 3      //Define the unit of servo pulse offset: 0.1ms
#define SERVO_MIN_MS 5+OFFSET_MS      //define the pulse duration for minimum angle of servo
```

```
#define SERVO_MAX_MS 25+OFFSET_MS      //define the pulse duration for maximum angle of servo
.....
void servoWriteMS(int pin, int ms) {
    if(ms > SERVO_MAX_MS)
        ms = SERVO_MAX_MS;
    if(ms < SERVO_MIN_MS)
        ms = SERVO_MIN_MS;
    softPwmWrite(pin, ms);
}
```

In subfunction **servoWrite()**, directly input an angle value (0-180 degrees), map the angle to the pulse width and then output it.

```
void servoWrite(int pin, int angle){      //Specif a certain rotation angle (0-180) for the
servo
    if(angle > 180)
        angle = 180;
    if(angle < 0)
        angle = 0;
    softPwmWrite(pin, map(angle, 0, 180, SERVO_MIN_MS, SERVO_MAX_MS));
}
```

Finally, in the "while" loop of the main function, use two "for" cycle to make servo rotate from 0 degrees to 180 degrees, and then from 180 degrees to 0 degrees.

```
while(1) {
    for(i=SEROV_MIN_MS;i<SERVO_MAX_MS;i++){ //make servo rotate from minimum angle to
maximum angle
        servoWriteMS(servopin, i);
        delay(10);
    }
    delay(500);
    for(i=SEROV_MAX_MS;i>SERVO_MIN_MS;i--){ //make servo rotate from maximum angle to
minimum angle
        servoWriteMS(servopin, i);
        delay(10);
    }
    delay(500);
}
```

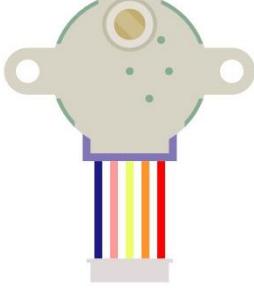

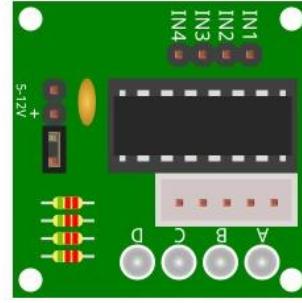

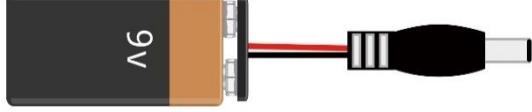

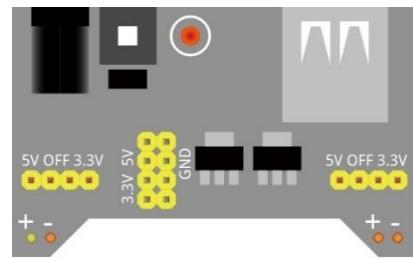

# Chapter 16 Stepper Motor

Thus far, we have learned about DC Motors and Servos. A DC motor can rotate constantly in one direction but we cannot control the rotation to a specific angle. On the contrary, a Servo can rotate to a specific angle but cannot rotate constantly in one direction. In this chapter, we will learn about a Stepper Motor which is also a type of motor. A Stepper Motor can rotate constantly and also to a specific angle. Using a Stepper Motor can easily achieve higher accuracies in mechanical motion.

## Project 16.1 Stepper Motor

In this project, we will learn how to drive a Stepper Motor, and understand its working principle.

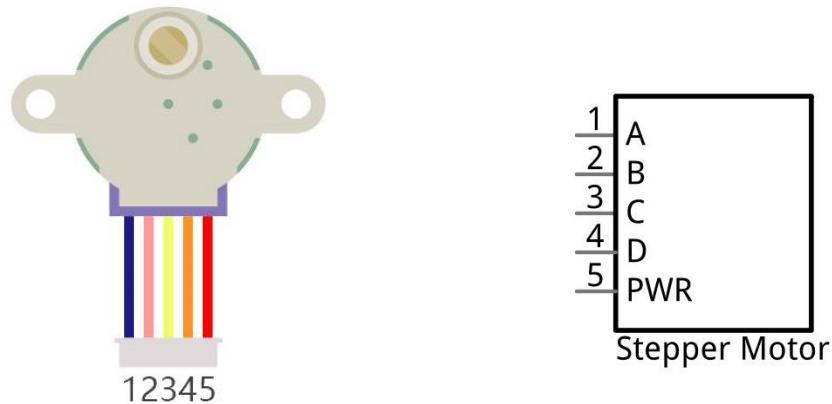

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper Wire x12 
Stepper Motor x1 	ULN2003 Stepper Motor Driver x1 
9V battery (prepared by yourself) & battery line 	Breadboard Power module x1 

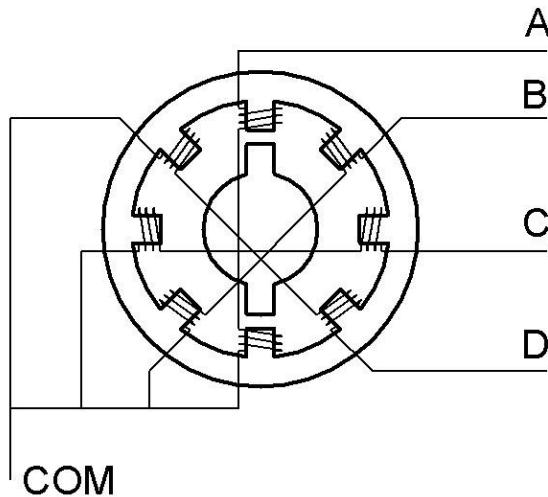

## Component knowledge

### Stepper Motor

Stepper Motors are an open-loop control device, which converts an electronic pulse signal into angular displacement or linear displacement. In a non-overload condition, the speed of the motor and the location of the stops depends only on the pulse signal frequency and number of pulses and is not affected by changes in load as with a DC Motor. A small Four-Phase Deceleration Stepper Motor is shown here:

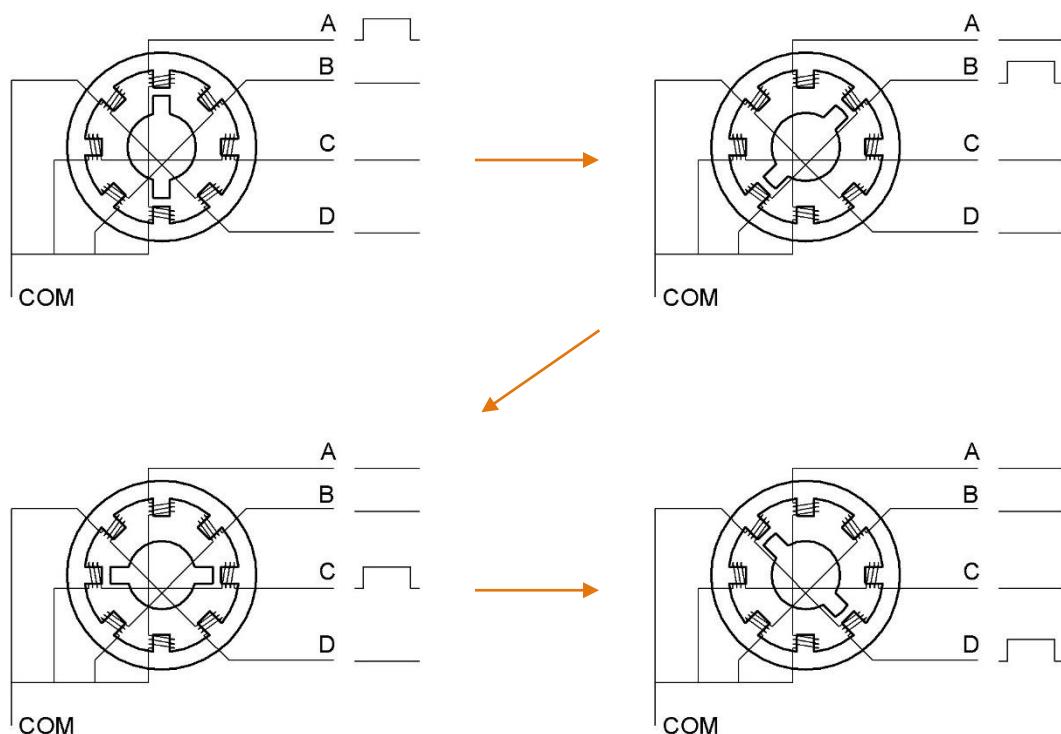

The electronic schematic diagram of a Four-Phase Stepper Motor is shown below:

The outside case or housing of the Stepper Motor is the Stator and inside the Stator is the Rotor. There is a specific number of individual coils, usually an integer multiple of the number of phases the motor has, when the Stator is powered ON, an electromagnetic field will be formed to attract a corresponding convex diagonal groove or indentation in the Rotor's surface. The Rotor is usually made of iron or a permanent magnet. Therefore, the Stepper Motor can be driven by powering the coils on the Stator in an ordered sequence (producing a series of "steps" or stepped movements).

A common driving sequence is shown here:

In the sequence above, the Stepper Motor rotates by a certain angle at once, which is called a "step". By controlling the number of rotational steps, you can then control the Stepper Motor's rotation angle. By defining the time between two steps, you can control the Stepper Motor's rotation speed. When rotating clockwise, the order of coil powered on is: A → B → C → D → A →……. And the rotor will rotate in accordance with this order, step by step, called four-steps, four-part. If the coils are powered ON in the reverse order, D → C → B → A → D →……, the rotor will rotate in counter-clockwise direction.

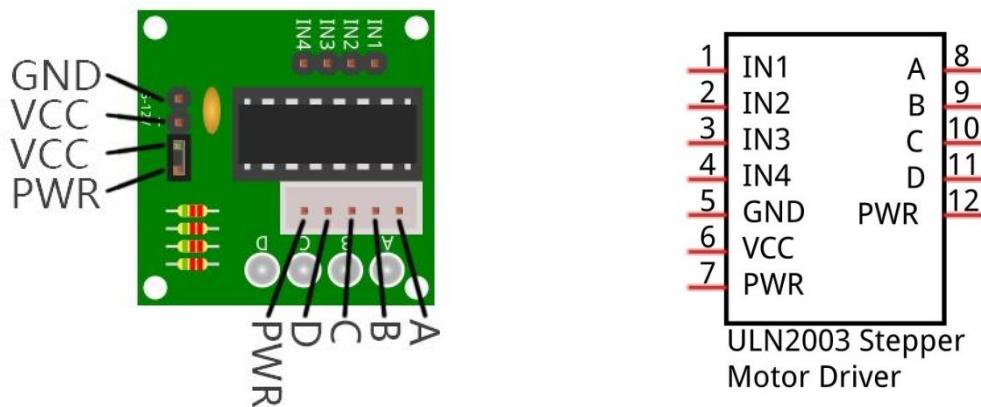

There are other methods to control Stepper Motors, such as: connect A phase, then connect A B phase, the stator will be located in the center of A B, which is called a half-step. This method can improve the stability of the Stepper Motor and reduces noise. This sequence of powering the coils looks like this: A → AB → B → BC → C → CD → D → DA → A →……, the rotor will rotate in accordance to this sequence at a half-step at a time, called four-steps, eight-part. Conversely, if the coils are powered ON in the reverse order the Stepper Motor will rotate in the opposite direction.

The stator in the Stepper Motor we have supplied has 32 magnetic poles. Therefore, to complete one full revolution requires 32 full steps. The rotor (or output shaft) of the Stepper Motor is connected to a speed reduction set of gears and the reduction ratio is 1:64. Therefore, the final output shaft (exiting the Stepper Motor's housing) requires  $32 \times 64 = 2048$  steps to make one full revolution.

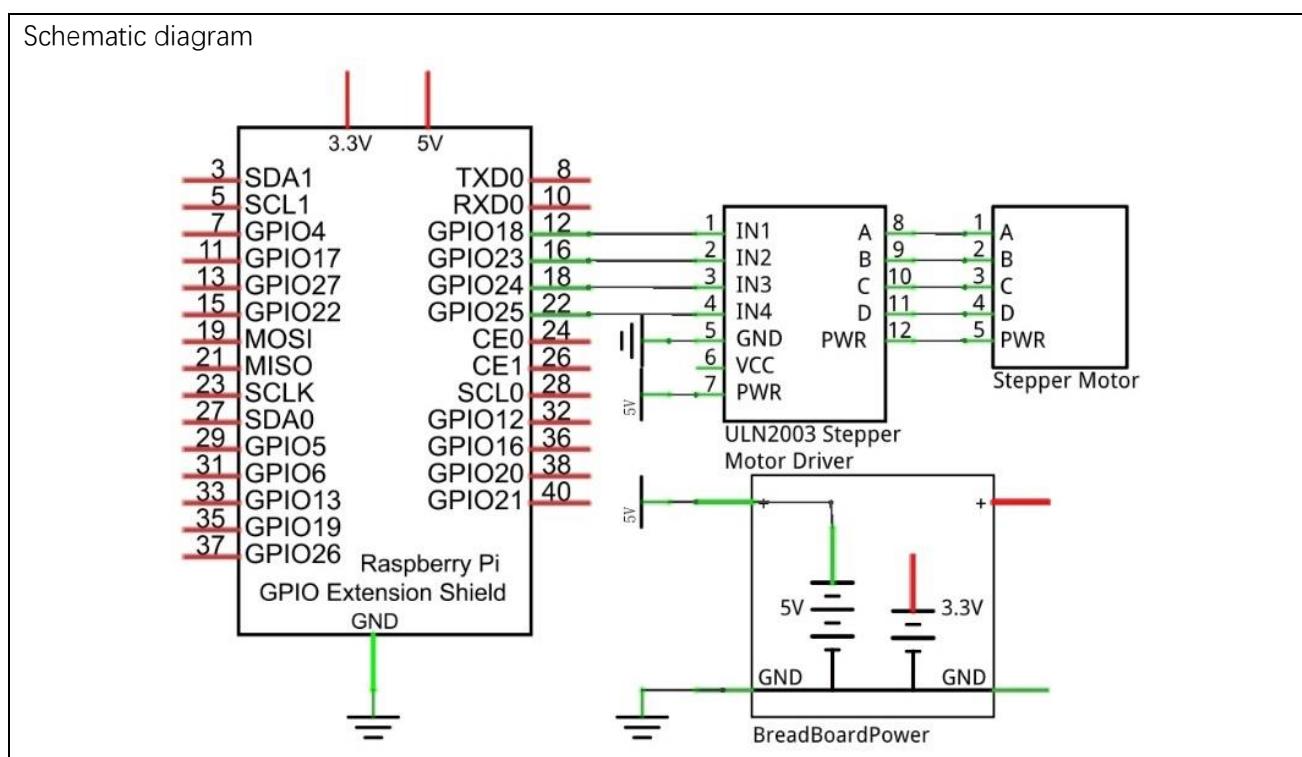

### ULN2003 Stepper Motor driver

A ULN2003 Stepper Motor Driver is used to convert weak signals into more powerful control signals in order to drive the Stepper Motor. In the illustration below, the input signal IN1-IN4 corresponds to the output signal A-D, and 4 LEDs are integrated into the board to indicate the state of these signals. The PWR interface can be used as a power supply for the Stepper Motor. By default, PWR and VCC are connected.

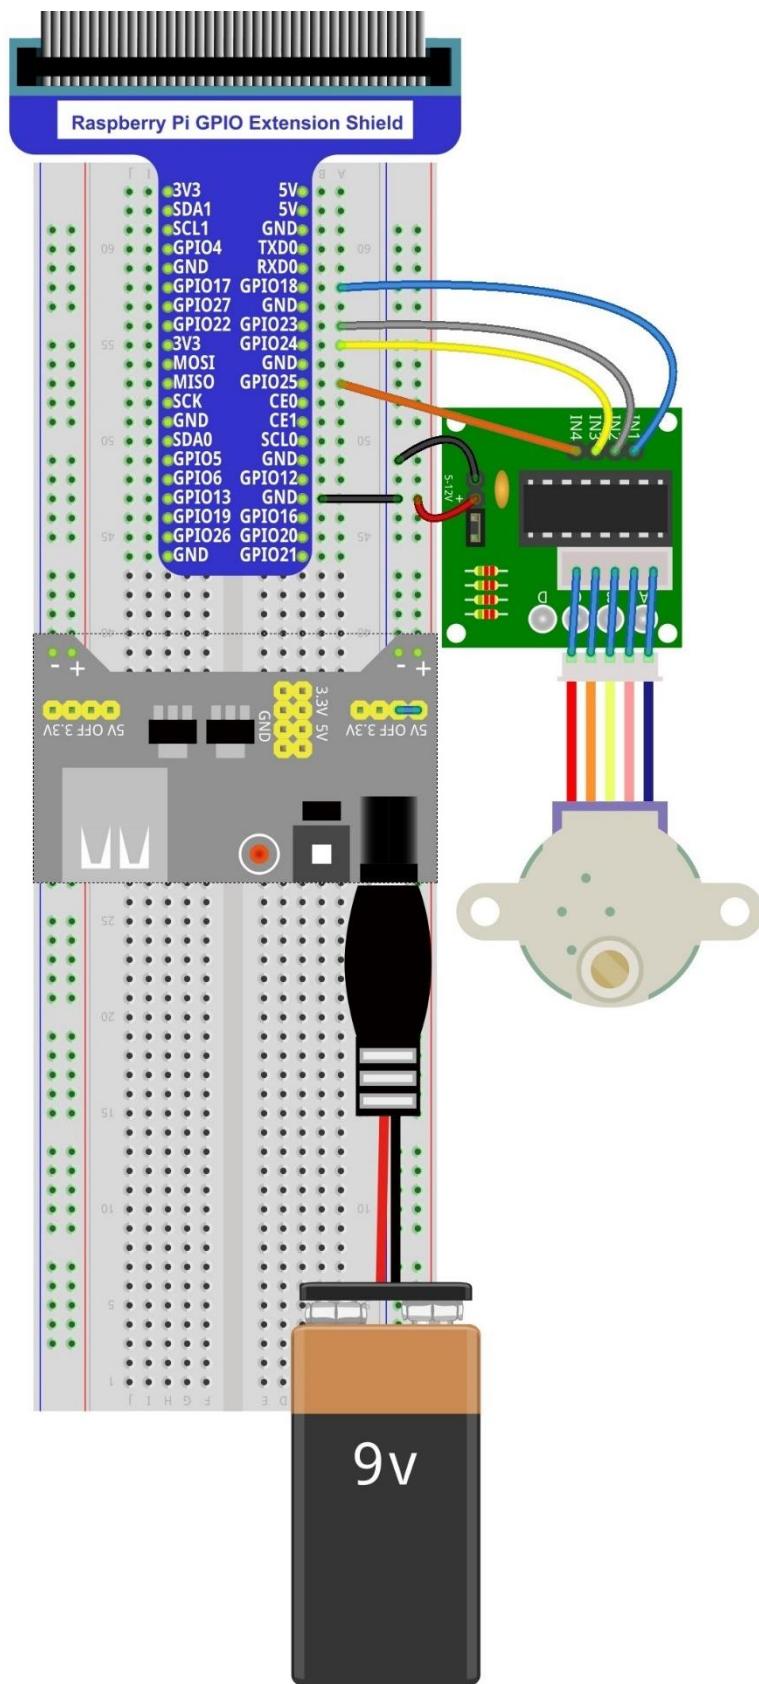

## Circuit

When building the circuit, note that rated voltage of the Stepper Motor is 5V, and we need to use the breadboard power supply independently, (**Caution do not use the RPi power supply**). Additionally, the breadboard power supply needs to share Ground with Rpi.

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

### C Code 16.1.1 SteppingMotor

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 16.1.1\_SteppingMotor directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/16.1.1_SteppingMotor
```

2. Use following command to compile "SteppingMotor.c" and generate executable file "SteppingMotor".

```
gcc SteppingMotor.c -o SteppingMotor -lwiringPi
```

3. Run the generated file "SteppingMotor".

```
sudo ./SteppingMotor
```

After the program is executed, the Stepper Motor will rotate 360° clockwise and then 360° anticlockwise and repeat this action in an endless loop.

The following is the program code:

```

1 #include <stdio.h>
2 #include <wiringPi.h>
3
4 const int motorPins[]={1, 4, 5, 6}; //define pins connected to four phase ABCD of stepper
motor
5 const int CCWStep[]={0x01, 0x02, 0x04, 0x08}; //define power supply order for coil for rotating
anticlockwise
6 const int CWStep[]={0x08, 0x04, 0x02, 0x01}; //define power supply order for coil for rotating
clockwise
7 //as for four phase Stepper Motor, four steps is a cycle. the function is used to drive the
Stepper Motor clockwise or anticlockwise to take four steps
8 void moveOnePeriod(int dir, int ms){
9     int i=0, j=0;
10    for (j=0; j<4; j++){ //cycle according to power supply order
11        for (i=0; i<4; i++){ //assign to each pin, a total of 4 pins
12            if(dir == 1) //power supply order clockwise
13                digitalWrite(motorPins[i], (CCWStep[j] == (1<<i)) ? HIGH : LOW);
14            else //power supply order anticlockwise
15                digitalWrite(motorPins[i], (CWStep[j] == (1<<i)) ? HIGH : LOW);
16            printf("motorPin %d, %d \n", motorPins[i], digitalRead(motorPins[i]));
17        }
18        printf("Step cycle!\n");
19        if(ms<3) //the delay can not be less than 3ms, otherwise it will exceed speed
limit of the motor
20            ms=3;
21        delay(ms);
22    }
23 }
24 //continuous rotation function, the parameter steps specifies the rotation cycles, every four

```

```

steps is a cycle
25 void moveSteps(int dir, int ms, int steps) {
26     int i;
27     for(i=0;i<steps;i++) {
28         moveOnePeriod(dir,ms);
29     }
30 }
31 void motorStop() { //function used to stop rotating
32     int i;
33     for(i=0;i<4;i++) {
34         digitalWrite(motorPins[i],LOW);
35     }
36 }
37 int main(void) {
38     int i;
39
40     printf("Program is starting ... \n");
41
42     wiringPiSetup();
43
44     for(i=0;i<4;i++) {
45         pinMode(motorPins[i],OUTPUT);
46     }
47
48     while(1) {
49         moveSteps(1, 3, 512); //rotating 360° clockwise, a total of 2048 steps in a circle,
namely, 512 cycles.
50         delay(500);
51         moveSteps(0, 3, 512); //rotating 360° anticlockwise
52         delay(500);
53     }
54     return 0;
55 }
```

In the code we define the four pins of the Stepper Motor and the order to supply power to the coils for a four-step rotation mode.

```

const int motorPins[]={1, 4, 5, 6}; //define pins connected to four phase ABCD of stepper
motor
const int CCWStep[]={0x01, 0x02, 0x04, 0x08}; //define power supply order for coil for rotating
anticlockwise
const int CWStep[]={0x08, 0x04, 0x02, 0x01}; //define power supply order for coil for rotating
clockwise
```

Subfunction **moveOnePeriod** ((int dir,int ms)) will drive the Stepper Motor rotating four-step clockwise or anticlockwise, four-step as a cycle. Where parameter "dir" indicates the rotation direction, if "dir" is 1, the servo will rotate clockwise, otherwise it rotates to anticlockwise. Parameter "ms" indicates the time between

each two steps. The "ms" of Stepper Motor used in this project is 3ms (the shortest time period), a value of less than 3ms will exceed the limits of the Stepper Motor with a result that it does not rotate.

```
void moveOnePeriod(int dir, int ms) {
    int i=0, j=0;
    for (j=0;j<4;j++) { //cycle according to power supply order
        for (i=0;i<4;i++) { //assign to each pin, a total of 4 pins
            if(dir == 1) //power supply order clockwise
                digitalWrite(motorPins[i], (CCWStep[j] == (1<<i)) ? HIGH : LOW);
            else //power supply order anticlockwise
                digitalWrite(motorPins[i], (CWStep[j] == (1<<i)) ? HIGH : LOW);
            printf("motorPin %d, %d \n", motorPins[i], digitalRead(motorPins[i]));
        }
        printf("Step cycle!\n");
        if(ms<3) //the delay can not be less than 3ms, otherwise it will exceed speed
        limit of the motor
            ms=3;
        delay(ms);
    }
}
```

Subfunction **moveSteps** (int dir, int ms, int steps) is used to specific cycle number of Stepper Motor.

```
void moveSteps(int dir, int ms, int steps) {
    int i;
    for(i=0;i<steps;i++)
        moveOnePeriod(dir, ms);
}
```

Subfunction **motorStop ()** is used to stop the Stepper Motor.

```
void motorStop() { //function used to stop rotating
    int i;
    for(i=0;i<4;i++)
        digitalWrite(motorPins[i], LOW);
}
```

Finally, in the while loop of main function, rotate one revolution clockwise, and then one revolution anticlockwise. According to the previous material covered, the Stepper Motor one revolution requires 2048 steps, that is,  $2048/4=512$  cycle.

```
while(1) {
    moveSteps(1, 3, 512); //rotating 360° clockwise, a total of 2048 steps in a
    circle, namely, this function(four steps) will be called 512 times.
    delay(500);
    moveSteps(0, 3, 512); //rotating 360° anticlockwise
    delay(500);
}
```

# Chapter 17 74HC595 & Bar Graph LED

We have used LED Bar Graph to make a flowing water light, in which 10 GPIO ports of RPi are occupied. More GPIO ports mean that more peripherals can be connected to RPi, so GPIO resource is very precious. Can we make flowing water light with less GPIO ports? In this chapter, we will learn a component, 74HC595, which can achieve the target.

## Project 17.1 Flowing Water Light

Now let us learn how to use the 74HC595 IC Chip to make a flowing water light using less GPIO.

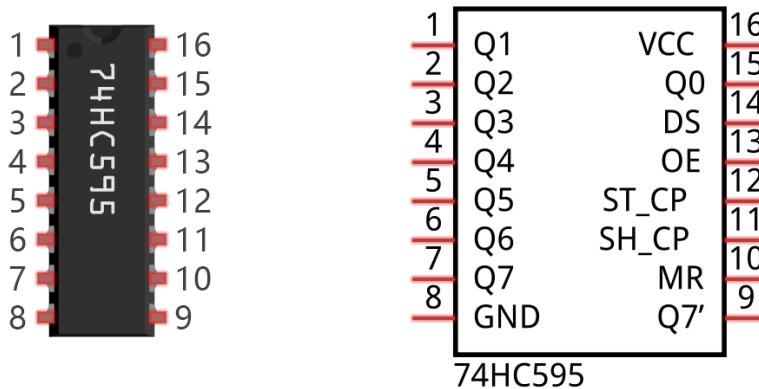

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Jumper x17 
74HC595 x1 	Bar Graph LED x1 
	Resistor 220Ω x8 

## Component knowledge

### 74HC595

A 74HC595 chip is used to convert serial data into parallel data. A 74HC595 chip can convert the serial data of one byte into 8 bits, and send its corresponding level to each of the 8 ports correspondingly. With this characteristic, the 74HC595 chip can be used to expand the IO ports of a Raspberry Pi. At least 3 ports on the RPI board are required to control the 8 ports of the 74HC595 chip.

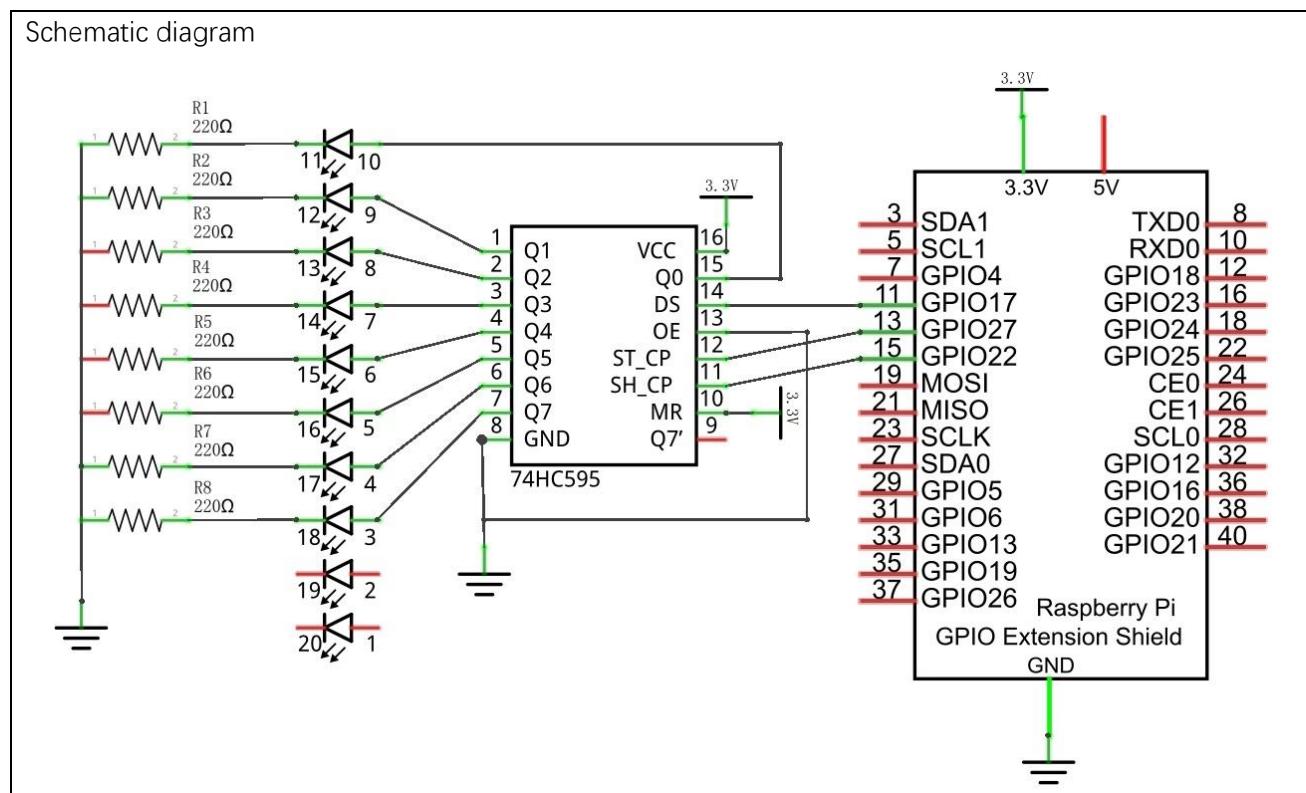

The ports of the 74HC595 chip are described as follows:

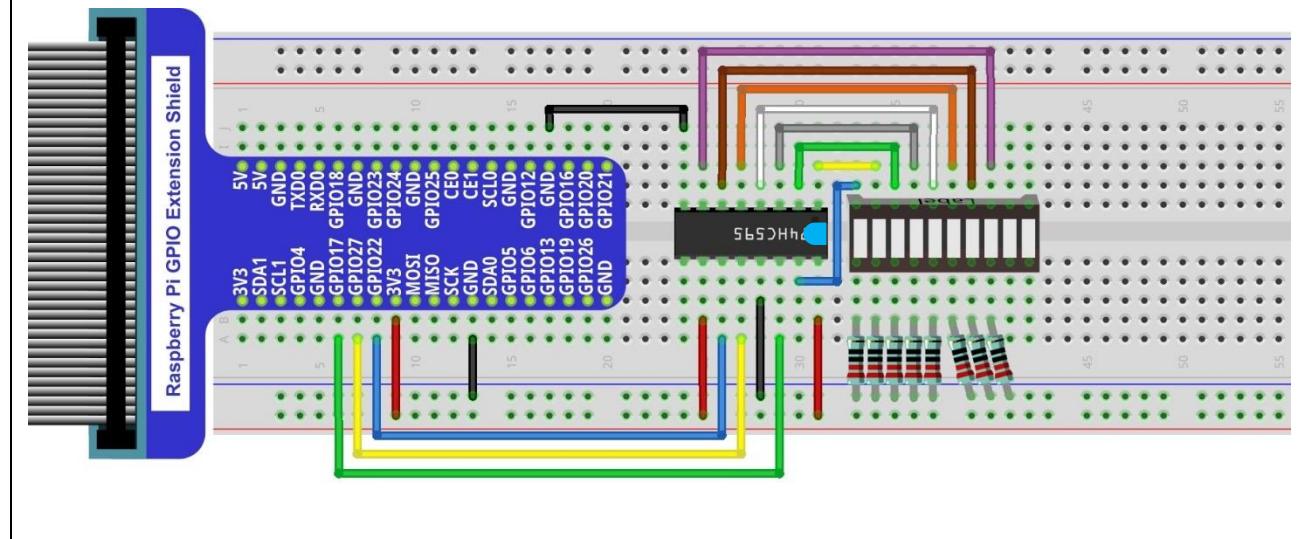

Pin name	Pin number	Description
Q0-Q7	15, 1-7	Parallel Data Output
VCC	16	The Positive Electrode of the Power Supply, the Voltage is 2~6V
GND	8	The Negative Electrode of Power Supply
DS	14	Serial Data Input
OE	13	Enable Output, When this pin is in high level, Q0-Q7 is in high resistance state When this pin is in low level, Q0-Q7 is in output mode
ST_CP	12	Parallel Update Output: when its electrical level is rising, it will update the parallel data output.
SH_CP	11	Serial Shift Clock: when its electrical level is rising, serial data input register will do a shift.
MR	10	Remove Shift Register: When this pin is in low level, the content in shift register will be cleared.
Q7'	9	Serial Data Output: it can be connected to more 74HC595 chips in series.

For more details, please refer to the datasheet on the 74HC595 chip.

## Circuit

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

In this project we will make a flowing water light with a 74HC595 chip to learn about its functions.

### C Code 17.1.1 LightWater02

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 17.1.1\_LightWater02 directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/17.1.1_LightWater02
```

2. Use following command to compile "LightWater02.c" and generate executable file "LightWater02".

```
gcc LightWater02.c -o LightWater02 -lwiringPi
```

3. Then run the generated file "LightWater02".

```
sudo ./LightWater02
```

After the program is executed, you will see that Bar Graph LED starts with the flowing water pattern flashing from left to right and then back from right to left.

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <wiringShift.h>
4
5 #define  dataPin  0 //DS Pin of 74HC595(Pin14)
6 #define  latchPin 2 //ST_CP Pin of 74HC595(Pin12)
7 #define  clockPin 3 //CH_CP Pin of 74HC595(Pin11)
8
9 void _shiftOut(int dPin, int cPin, int order, int val) {
10    int i;
11    for(i = 0; i < 8; i++){
12        digitalWrite(cPin, LOW);
13        if(order == LSBFIRST){
14            digitalWrite(dPin, ((0x01&(val>>i)) == 0x01) ? HIGH : LOW);
15            delayMicroseconds(10);
16        }
17        else {//if(order == MSBFIRST){
18            digitalWrite(dPin, ((0x80&(val<<i)) == 0x80) ? HIGH : LOW);
19            delayMicroseconds(10);
20        }
21        digitalWrite(cPin, HIGH);
22        delayMicroseconds(10);
23    }
24 }
25
26 int main(void)
27 {
28     int i;

```

```

29     unsigned char x;
30
31     printf("Program is starting ... \n");
32
33     wiringPiSetup();
34
35     pinMode(dataPin, OUTPUT);
36     pinMode(latchPin, OUTPUT);
37     pinMode(clockPin, OUTPUT);
38
39     while(1) {
40
41         x=0x01;
42         for(i=0;i<8;i++) {
43
44             digitalWrite(latchPin,LOW);           // Output low level to latchPin
45             _shiftOut(dataPin,clockPin,LSBFIRST,x);// Send serial data to 74HC595
46
47             digitalWrite(latchPin,HIGH);        //Output high level to latchPin, and 74HC595 will
48             update the data to the parallel output port.
49
50             x<<=1;           //make the variable move one bit to left once, then the bright LED
51             move one step to the left once.
52
53             delay(100);
54
55         }
56
57     }
58 }
```

In the code, we configure three pins to control the 74HC595 chip and define a one-byte variable to control the state of the 8 LEDs (in the Bar Graph LED Module) through the 8 bits of the variable. The LEDs light ON when the corresponding bit is 1. If the variable is assigned to 0x01, that is 00000001 in binary, there will be only one LED ON.

x=0x01;
---------

In the “while” cycle of main function, use two cycles to send x to 74HC595 output pin to control the LED. In one cycle, x will shift one bit to the LEFT in one cycle, then when data of x is sent to 74HC595, the LED that is turned ON will move one bit to the LEFT once.

	<pre> for(i=0;i&lt;8;i++) {     digitalWrite(latchPin,LOW);           // Output low level to latchPin     _shiftOut(dataPin,clockPin,LSBFIRST,x);// Send serial data to 74HC595     digitalWrite(latchPin,HIGH);        // Output high level to latchPin, and 74HC595 will     update the data to the parallel output port. }</pre>
--	---

```

x<<=1; // make the variable move one bit to left once, then the bright LED move
one step to the left once.

delay(100);

}

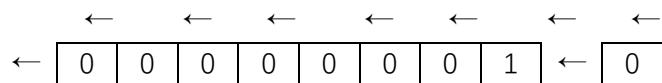

```

In second cycle, the situation is the same. The difference is that x is shift from 0x80 to the RIGHT in order.

### << operator

"<<" is the left shift operator, which can make all bits of 1 byte shift by several bits to the left (high) direction and add 0 on the right (low). For example, shift binary 00000001 by 1 bit to left:

byte x = 1 << 1;

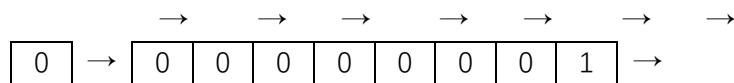

The result of x is 2 (binary 00000010) .

There is another similar operator " >> ". For example, shift binary 00000001 by 1 bit to right:

byte x = 1 >> 1;

The result of x is 0 (00000000) .

X <<= 1 is equivalent to x = x << 1 and x >>= 1 is equivalent to x = x >> 1

About shift function

`uint8_t shiftIn (uint8_t dPin, uint8_t cPin, uint8_t order);`

This is used to shift an 8-bit data value in with the data appearing on the dPin and the clock being sent out on the cPin. Order is either LSBFIRST or MSBFIRST. The data is sampled after the cPin goes high. (So cPin high, sample data, cPin low, repeat for 8 bits) The 8-bit value is returned by the function.

`void shiftOut (uint8_t dPin, uint8_t cPin, uint8_t order, uint8_t val);`

`void _shiftOut (uint8_t dPin, uint8_t cPin, uint8_t order, uint8_t val);`

This is used to shift an 8-bit data value out with the data being sent out on dPin and the clock being sent out on the cPin. order is as above. Data is clocked out on the rising or falling edge - ie. dPin is set, then cPin is taken high then low - repeated for the 8 bits.

For more details about shift function, please refer to: <http://wiringpi.com/reference/shift-library/>

# Chapter 18 74HC595 & 7-Segment Display

In this chapter, we will introduce the 7-Segment Display.

## Project 18.1 7-Segment Display

We will use a 74HC595 IC Chip to control a 7-Segment Display and make it display sixteen decimal characters "0" to "F".

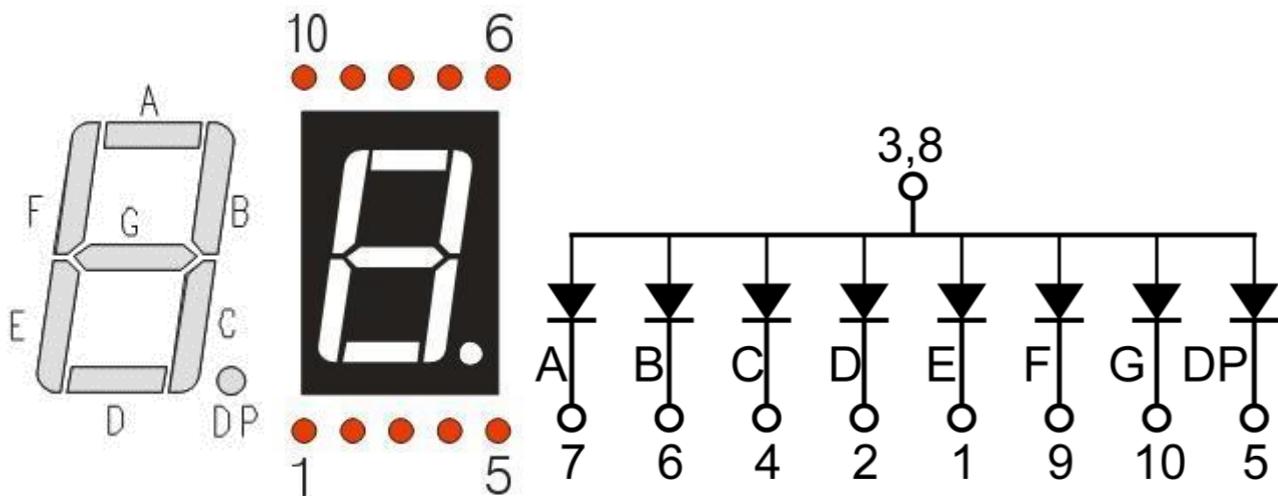

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Jumper Wire x18 
74HC595 x1 	7-Segment Display x1 
	Resistor 220Ω x8 

## Component knowledge

### 7-segment display

A 7-Segment Display is a digital electronic display device. There is a figure "8" and a decimal point represented, which consists of 8 LEDs. The LEDs have a Common Anode and individual Cathodes. Its internal structure and pin designation diagram is shown below:

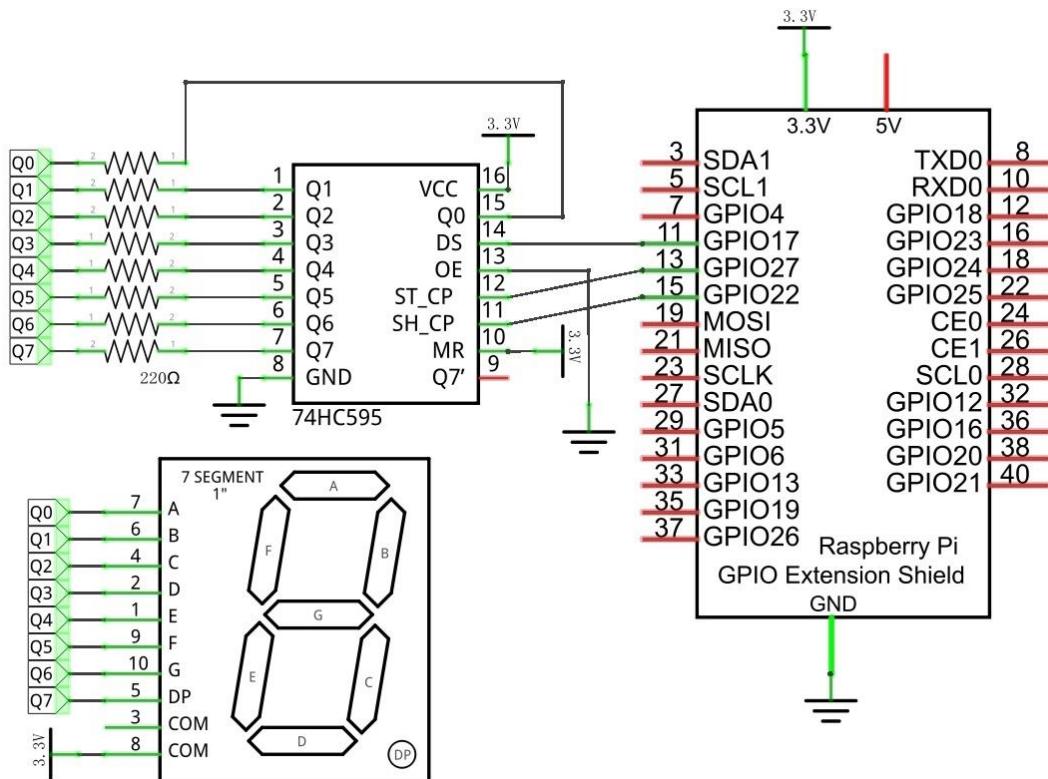

As we can see in the above circuit diagram, we can control the state of each LED separately. Also, by combining LEDs with different states of ON and OFF, we can display different characters (Numbers and Letters). For example, to display a "0": we need to turn ON LED segments A, B, C, D, E and F, and turn OFF LED segments G and DP.

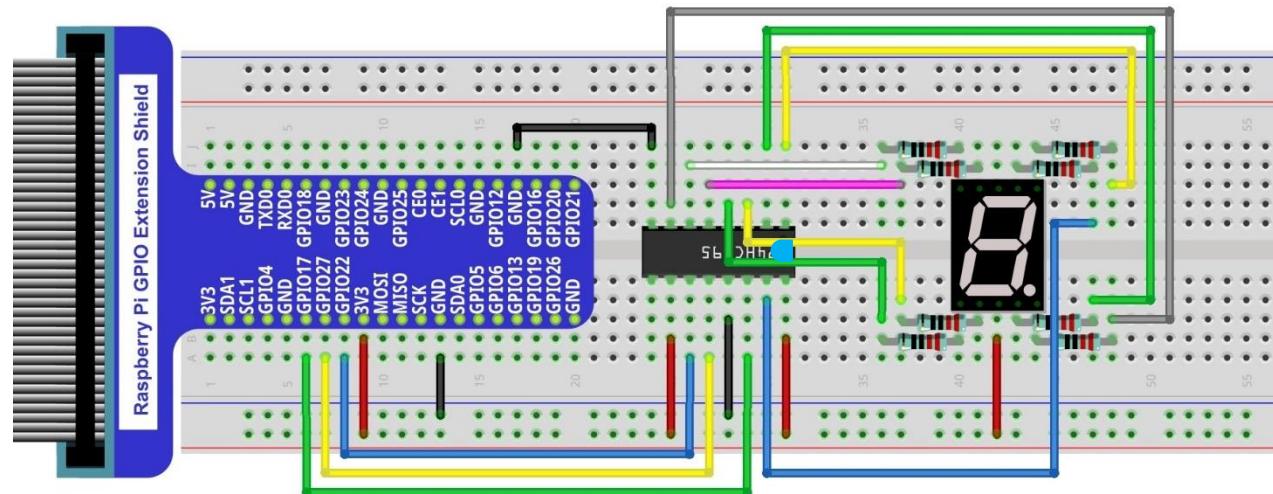

In this project, we will use a 7-Segment Display with a Common Anode. Therefore, when there is an input low level to an LED segment the LED will turn ON. Defining segment "A" as the lowest level and segment "DP" as the highest level, from high to low would look like this: "DP", "G", "F", "E", "D", "C", "B", "A". Character "0" corresponds to the code:  $1100\ 0000_2 = 0xc0$ .

## Circuit

Schematic diagram

Hardware connection. If you need any support, please free to contact us via: [support@freenove.com](mailto:support@freenove.com)

Video: <https://youtu.be/KSE0LdyuOFM>

## Code

This code uses a 74HC595 IC Chip to control the 7-Segment Display. The use of the 74HC595 IC Chip is generally the same throughout this Tutorial. We need code to display the characters "0" to "F" one character at a time, and then output to display them with the 74HC595 IC Chip.

### C Code 18.1.1 SevenSegmentDisplay

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 18.1.1\_SevenSegmentDisplay directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/18.1.1_SevenSegmentDisplay
```

2. Use following command to compile "SevenSegmentDisplay.c" and generate executable file "SevenSegmentDisplay".

```
gcc SevenSegmentDisplay.c -o SevenSegmentDisplay -lwiringPi
```

3. Then run the generated file "SevenSegmentDisplay".

```
sudo ./SevenSegmentDisplay
```

After the program is executed, the 7-Segment Display starts to display the characters "0" to "F" in succession.

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <wiringShift.h>
4
5 #define dataPin 0 //DS Pin of 74HC595(Pin14)
6 #define latchPin 2 //ST_CP Pin of 74HC595(Pin12)
7 #define clockPin 3 //CH_CP Pin of 74HC595(Pin11)
8 //encoding for character 0-F of common anode SevenSegmentDisplay.
9 unsigned char
10 num[]={0xc0, 0xf9, 0xa4, 0xb0, 0x99, 0x92, 0x82, 0xf8, 0x80, 0x90, 0x88, 0x83, 0xc6, 0xa1, 0x86, 0x8e} ;
11
12 void _shiftOut(int dPin, int cPin, int order, int val) {
13     int i;
14     for(i = 0; i < 8; i++) {
15         digitalWrite(cPin, LOW);
16         if(order == LSBFIRST) {
17             digitalWrite(dPin, ((0x01&(val>>i)) == 0x01) ? HIGH : LOW);
18             delayMicroseconds(10);
19         }
20         else {//if(order == MSBFIRST) {
21             digitalWrite(dPin, ((0x80&(val<<i)) == 0x80) ? HIGH : LOW);
22             delayMicroseconds(10);
23         }
24         digitalWrite(cPin, HIGH);
25         delayMicroseconds(10);
26     }
}
```

```

27 }
28
29 int main(void)
30 {
31     int i;
32
33     printf("Program is starting ... \n");
34
35     wiringPiSetup();
36
37     pinMode(dataPin, OUTPUT);
38     pinMode(latchPin, OUTPUT);
39     pinMode(clockPin, OUTPUT);
40     while(1) {
41         for(i=0;i<sizeof(num);i++) {
42             digitalWrite(latchPin, LOW);
43             _shiftOut(dataPin, clockPin, MSBFIRST, num[i]); //Output the figures and the highest
level is transferred preferentially.
44             digitalWrite(latchPin, HIGH);
45             delay(500);
46         }
47         for(i=0;i<sizeof(num);i++) {
48             digitalWrite(latchPin, LOW);
49             _shiftOut(dataPin, clockPin, MSBFIRST, num[i] & 0x7f); //Use the "&0x7f" to display
the decimal point.
50             digitalWrite(latchPin, HIGH);
51             delay(500);
52         }
53     }
54     return 0;
55 }
```

First, we need to create encoding for characters “0” to “F” in the array.

```

unsigned char
num[]={0xc0, 0xf9, 0xa4, 0xb0, 0x99, 0x92, 0x82, 0xf8, 0x80, 0x90, 0x88, 0x83, 0xc6, 0xa1, 0x86, 0x8e};
```

In the “for” loop of loop() function, use the 74HC595 IC Chip to output contents of array “num” successively. SevenSegmentDisplay can then correctly display the corresponding characters. Pay attention to this in regard to shiftOut function, the transmission bit, flag bit and highest bit will be transmitted preferentially.

```

for(i=0;i<sizeof(num);i++) {
    digitalWrite(latchPin, LOW);
    _shiftOut(dataPin, clockPin, MSBFIRST, num[i]); //Output the figures and the highest
level is transferred preferentially.
    digitalWrite(latchPin, HIGH);
    delay(500);
}
```

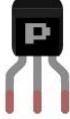

If you want to display the decimal point, make the highest bit of each array “0”, which can be implemented easily by `num[i]&0x7f`.

```
_shift0ut(dataPin, clockPin, MSBFIRST, num[i] & 0x7f);
```

## Project 18.2 4-Digit 7-Segment Display

Now, let's try to control more-than-one digit displays by using a Four 7-Segment Display in one project.

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Wire x1 Breadboard x1	Jumper Wire x30			
74HC595 x1 	PNP transistor x4 	4-Digit 7-Segment Display x1 	Resistor 220Ω x8 	Resistor 1KΩ x4 

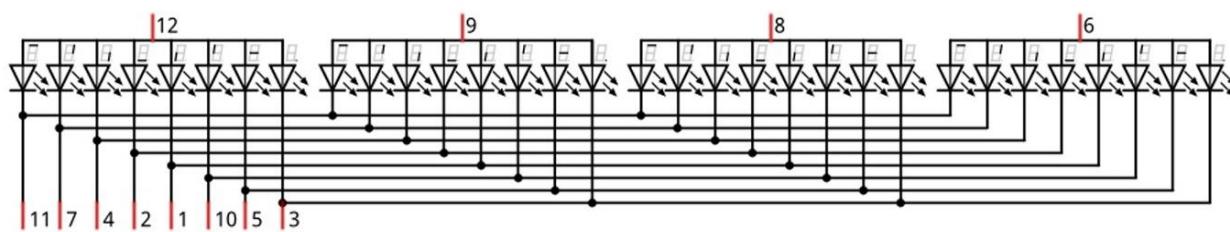

## Component knowledge

### 4 Digit 7-Segment Display

A 4 Digit 7-segment display integrates four 7-Segment Displays into one module, therefore it can display more characters. All of the LEDs contained have a Common Anode and individual Cathodes. Its internal structure and pin designation diagram is shown below:

The internal electronic circuit is shown below, and all 8 LED cathode pins of each 7-Segment Display are connected together.

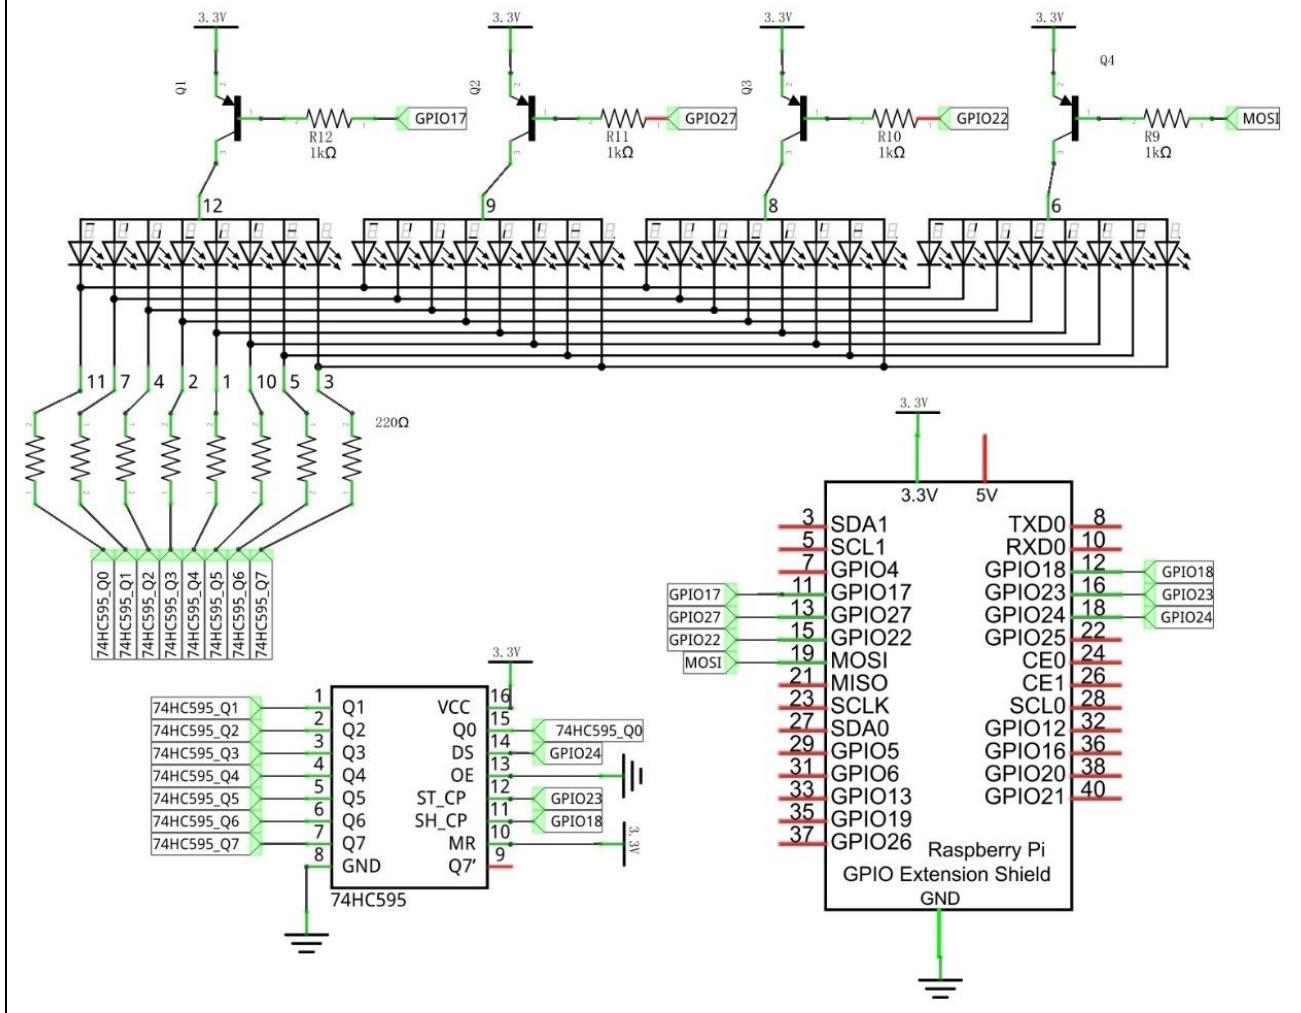

Display method of 4 Digit 7-segment display is similar to 1 Digit 7-segment display. The difference between them is that the 4-Digit displays each Digit is visible in turn, one by one and not together. We need to first send high level to the common end of the first Digit Display, and send low level to the remaining three common ends, and then send content to 8 LED cathode pins of the first Digit Display. At this time, the first 7-Segment Display will show visible content and the remaining three will be OFF.

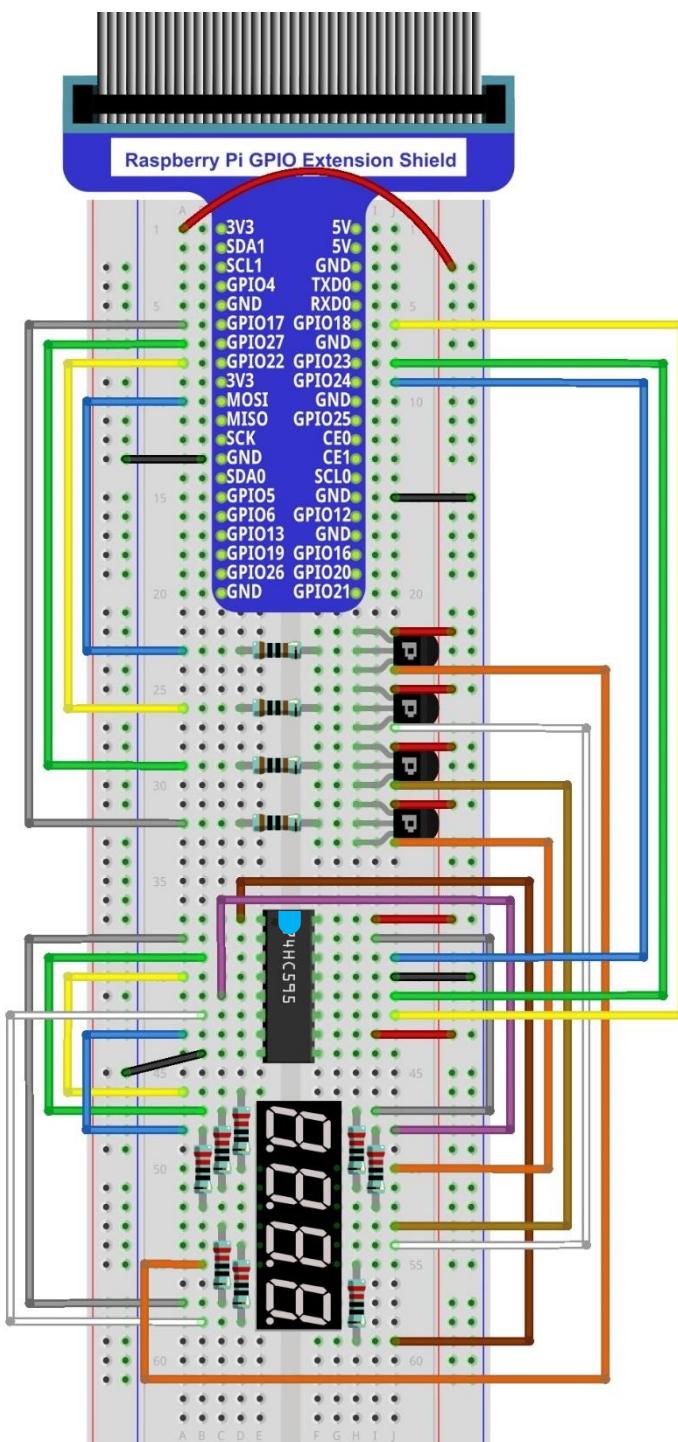

Similarly, the second, third and fourth 7-Segment Displays will show visible content in turn by scanning the display. Although the four number characters are displayed in turn separately, this process is so very fast that it is unperceivable to the naked eye. This is due to the principle of optical afterglow effect and the vision persistence effect in human sight. This is how we can see all 4 number characters at the same time. However, if each number character is displayed for a longer period, you will be able to see that the number characters are displayed separately.

## Circuit

Schematic diagram

## Hardware connection

## Code

In this code, we use the 74HC595 IC Chip to control the 4-Digit 7-Segment Display, and use the dynamic scanning method to show the changing number characters.

### C Code 18.2.1 StopWatch

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/18.2.1_StopWatch
```

2. Use following command to compile "StopWatch.c" and generate executable file "StopWatch".

```
gcc StopWatch.c -o StopWatch -lwiringPi
```

3. Run the generated file "StopWatch".

```
sudo ./StopWatch
```

After the program is executed, the 4-Digit 7-Segment Display starts displaying a four-digit number dynamically, and the numeric value of this number will increase by plus 1 each second thereafter.

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <wiringShift.h>
4 #include <signal.h>
5 #include <unistd.h>
6 #define    dataPin      5 //DS Pin of 74HC595(Pin14)
7 #define    latchPin     4 //ST_CP Pin of 74HC595(Pin12)
8 #define    clockPin     1 //CH_CP Pin of 74HC595(Pin11)
9 const int digitPin[]={0,2,3,12};           // Define 7-segment display common pin
10 // character 0~9 code of common anode 7-segment display
11 unsigned char num[]={0xc0,0xf9,0xa4,0xb0,0x99,0x92,0x82,0xf8,0x80,0x90};
12 int counter = 0; //variable counter, the number will be displayed by 7-segment display
13 //Open one of the 7-segment display and close the remaining three, the parameter digit is
14 //optional for 1,2,4,8
15 void selectDigit(int digit){
16     digitalWrite(digitPin[0], ((digit&0x08) == 0x08) ? LOW : HIGH);
17     digitalWrite(digitPin[1], ((digit&0x04) == 0x04) ? LOW : HIGH);
18     digitalWrite(digitPin[2], ((digit&0x02) == 0x02) ? LOW : HIGH);
19     digitalWrite(digitPin[3], ((digit&0x01) == 0x01) ? LOW : HIGH);
20 }
21 void _shiftOut(int dPin, int cPin, int order, int val){
22     int i;
23     for(i = 0; i < 8; i++){
24         digitalWrite(cPin,LOW);
25         if(order == LSBFIRST){
26             digitalWrite(dPin, ((0x01&(val>>i)) == 0x01) ? HIGH : LOW);
27             delayMicroseconds(1);
```

```
27     }
28     else {//if(order == MSBFIRST) {
29         digitalWrite(dPin, ((0x80&(val<<i)) == 0x80) ? HIGH : LOW);
30         delayMicroseconds(1);
31     }
32     digitalWrite(cPin, HIGH);
33     delayMicroseconds(1);
34 }
35 }
36 void outData(int8_t data){      //function used to output data for 74HC595
37     digitalWrite(latchPin,LOW);
38     _shiftOut(dataPin,clockPin,MSBFIRST,data);
39     digitalWrite(latchPin,HIGH);
40 }
41 void display(int dec){ //display function for 7-segment display
42     int delays = 1;
43     outData(0xff);
44     selectDigit(0x01);      //select the first, and display the single digit
45     outData(num[dec%10]);
46     delay(delays);        //display duration
47
48     outData(0xff);
49     selectDigit(0x02);      //select the second, and display the tens digit
50     outData(num[dec%100/10]);
51     delay(delays);
52
53     outData(0xff);
54     selectDigit(0x04);      //select the third, and display the hundreds digit
55     outData(num[dec%1000/100]);
56     delay(delays);
57
58     outData(0xff);
59     selectDigit(0x08);      //select the fourth, and display the thousands digit
60     outData(num[dec%10000/1000]);
61     delay(delays);
62 }
63 void timer(int sig){ //Timer function
64     if(sig == SIGALRM){ //If the signal is SIGALRM, the value of counter plus 1, and update
the number displayed by 7-segment display
65         counter++;
66         alarm(1);           //set the next timer time
67         printf("counter : %d \n",counter);
68     }
69 }
```

```

70 int main(void)
71 {
72     int i;
73
74     printf("Program is starting ... \n");
75
76     wiringPiSetup();
77
78     pinMode(dataPin, OUTPUT);           //set the pin connected to 74HC595 for output mode
79     pinMode(latchPin, OUTPUT);
80     pinMode(clockPin, OUTPUT);
81     //set the pin connected to 7-segment display common end to output mode
82     for(i=0;i<4;i++) {
83         pinMode(digitPin[i], OUTPUT);
84         digitalWrite(digitPin[i], HIGH);
85     }
86     signal(SIGALRM, timer); //configure the timer
87     alarm(1);             //set the time of timer to 1s
88     while(1) {
89         display(counter); //display the number counter
90     }
91     return 0;
92 }
```

First, we define the pin of the 74HC595 IC Chip and the 7-Segment Display Common Anode, use character encoding and a variable "counter" to enable the counter to be visible on the 7-Segment Display.

```

#define      dataPin      5 //DS Pin of 74HC595(Pin14)
#define      latchPin     4 //ST_CP Pin of 74HC595(Pin12)
#define      clockPin     1 //CH_CP Pin of 74HC595(Pin11)
const int digitPin[]={0,2,3,12}; //Define the pin of 7-segment display common end
// character 0~9 code of common anode 7-segment display
unsigned char num[]={0xc0,0xf9,0xa4,0xb0,0x99,0x92,0x82,0xf8,0x80,0x90};
int counter = 0; //variable counter, the number will be displayed by 7-segment display
```

Subfunction **selectDigit** (int digit) function is used to open one of the 7-Segment Displays while closing the other 7-Segment Displays, where the parameter digit value can be 1,2,4,8. Using "|" can open a number of a 7-Segment Display.

```

void selectDigit(int digit) {
    digitalWrite(digitPin[0], ((digit&0x08) == 0x08) ? LOW : HIGH);
    digitalWrite(digitPin[1], ((digit&0x04) == 0x04) ? LOW : HIGH);
    digitalWrite(digitPin[2], ((digit&0x02) == 0x02) ? LOW : HIGH);
    digitalWrite(digitPin[3], ((digit&0x01) == 0x01) ? LOW : HIGH);
}
```

Subfunction **outData** (int8\_t data) is used to make the 74HC595 IC Chip output an 8-bit data immediately.

```
void outData(int8_t data){      // function used to output data for 74HC595
    digitalWrite(latchPin, LOW);
    shiftOut(dataPin, clockPin, MSBFIRST, data);
    digitalWrite(latchPin, HIGH);
}
```

Subfunction **display** (int dec) is used to make a 4-Digit 7-Segment Display a 4-bit integer. First open the common end of first 7-Segment Display Digit and turn OFF the other three Digits, now it can be used as 1-Digit 7-Segment Display. The first Digit is used for displaying single digits of "dec", the second Digit is for tens, the third for hundreds and fourth for thousands respectively. Each digit will be displayed for a period by using **delay()**. The time in this code is very brief, so you will see digits all together. If the time is set long enough, you will see that every digit is displayed independently.

```
void display(int dec){ //display function for 7-segment display
    selectDigit(0x01);      //select the first, and display the single digit
    outData(num[dec%10]);
    delay(1);                //display duration
    selectDigit(0x02);      //Select the second, and display the tens digit
    outData(num[dec%100/10]);
    delay(1);
    selectDigit(0x04);      //Select the third, and display the hundreds digit
    outData(num[dec%1000/100]);
    delay(1);
    selectDigit(0x08);      //Select the fourth, and display the thousands digit
    outData(num[dec%10000/1000]);
    delay(1);
}
```

Subfunction **timer** (int sig) is the timer function, which will set an alarm to signal. This function will be executed once at set time intervals. Accompanied by the execution, "1" will be added as the variable counter and then reset the time of timer to 1s.

```
void timer(int sig){      //timer function
    if(sig == SIGALRM){ //If the signal is SIGALRM, the value of counter plus 1, and update
        the number displayed by 7-segment display
        counter++;
        alarm(1);          //set the next timer time
    }
}
```

Finally, in the main function, configure the GPIO, and set the timer function.

```
pinMode(dataPin, OUTPUT);           //set the pin connected to 74HC595 for output mode
pinMode(latchPin, OUTPUT);
pinMode(clockPin, OUTPUT);
//set the pin connected to 7-segment display common end to output mode
for(i=0;i<4;i++) {
    pinMode(digitPin[i], OUTPUT);
    digitalWrite(digitPin[i], LOW);
}
signal(SIGALRM, timer); //configure the timer
alarm(1);             //set the time of timer to 1s
```

In the while loop, make the digital display variable counter value “1”. The value will change in function timer (), so the content displayed by the 7-Segment Display will change accordingly.

```
while(1) {
    display(counter); //display number counter
}
```

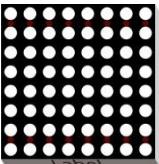

# Chapter 19 74HC595 & LED Matrix

Thus far we have learned how to use the 74HC595 IC Chip to control the Bar Graph LED and the 7-Segment Display. We will now use 74HC595 IC Chips to control an LED Matrix.

## Project 19.1 LED Matrix

In this project, we will use two 74HC595 IC chips to control a monochrome (one color) (8X8) LED Matrix to make it display both simple graphics and characters.

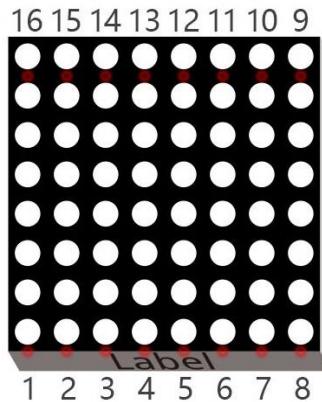

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Extension Board & Ribbon Cable x1 Breadboard x1	Jumper x36	
74HC595 x2	8X8 LEDMatrix x1	
		Resistor 220Ω x8

## Component knowledge

### LED matrix

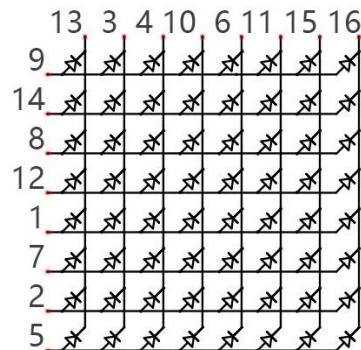

An LED Matrix is a rectangular display module that consists of a uniform grid of LEDs. The following is an 8X8 monochrome (one color) LED Matrix containing 64 LEDs (8 rows by 8 columns).

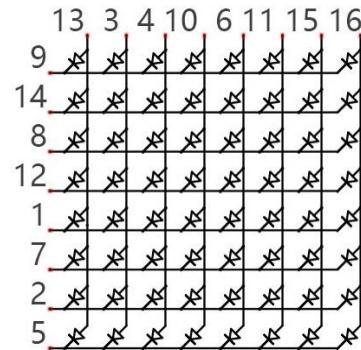

In order to facilitate the operation and reduce the number of ports required to drive this component, the Positive Poles of the LEDs in each row and Negative Poles of the LEDs in each column are respectively connected together inside the LED Matrix module, which is called a Common Anode. There is another arrangement type. Negative Poles of the LEDs in each row and the Positive Poles of the LEDs in each column are respectively connected together, which is called a Common Cathode.

The LED Matrix that we use in this project is a Common Anode LED Matrix.

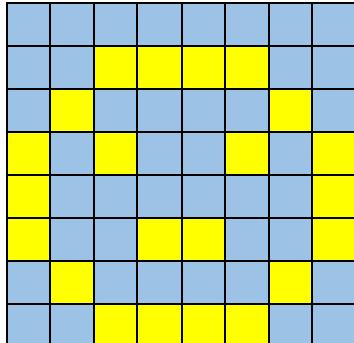

Connection mode of Common Anode

Connection mode of Common Cathode

Here is how a Common Anode LED Matrix works. First, choose 16 ports on RPi board to connect to the 16 ports of LED Matrix. Configure one port in columns for low level, which makes that column the selected port. Then configure the eight port in the row to display content in the selected column. Add a delay value and then select the next column that outputs the corresponding content. This kind of operation by column is called Scan. If you want to display the following image of a smiling face, you can display it in 8 columns, and each column is represented by one byte.

1	2	3	4	5	6	7	8
0	0	0	0	0	0	0	0
0	0	1	1	1	1	0	0
0	1	0	0	0	0	1	0
1	0	1	0	0	1	0	1
1	0	0	0	0	0	0	1
1	0	0	1	1	0	0	1
0	1	0	0	0	0	1	0
0	0	1	1	1	1	0	0

Column	Binary	Hexadecimal
1	0001 1100	0x1c
2	0010 0010	0x22
3	0101 0001	0x51
4	0100 0101	0x45
5	0100 0101	0x45
6	0101 0001	0x51
7	0010 0010	0x22
8	0001 1100	0x1c

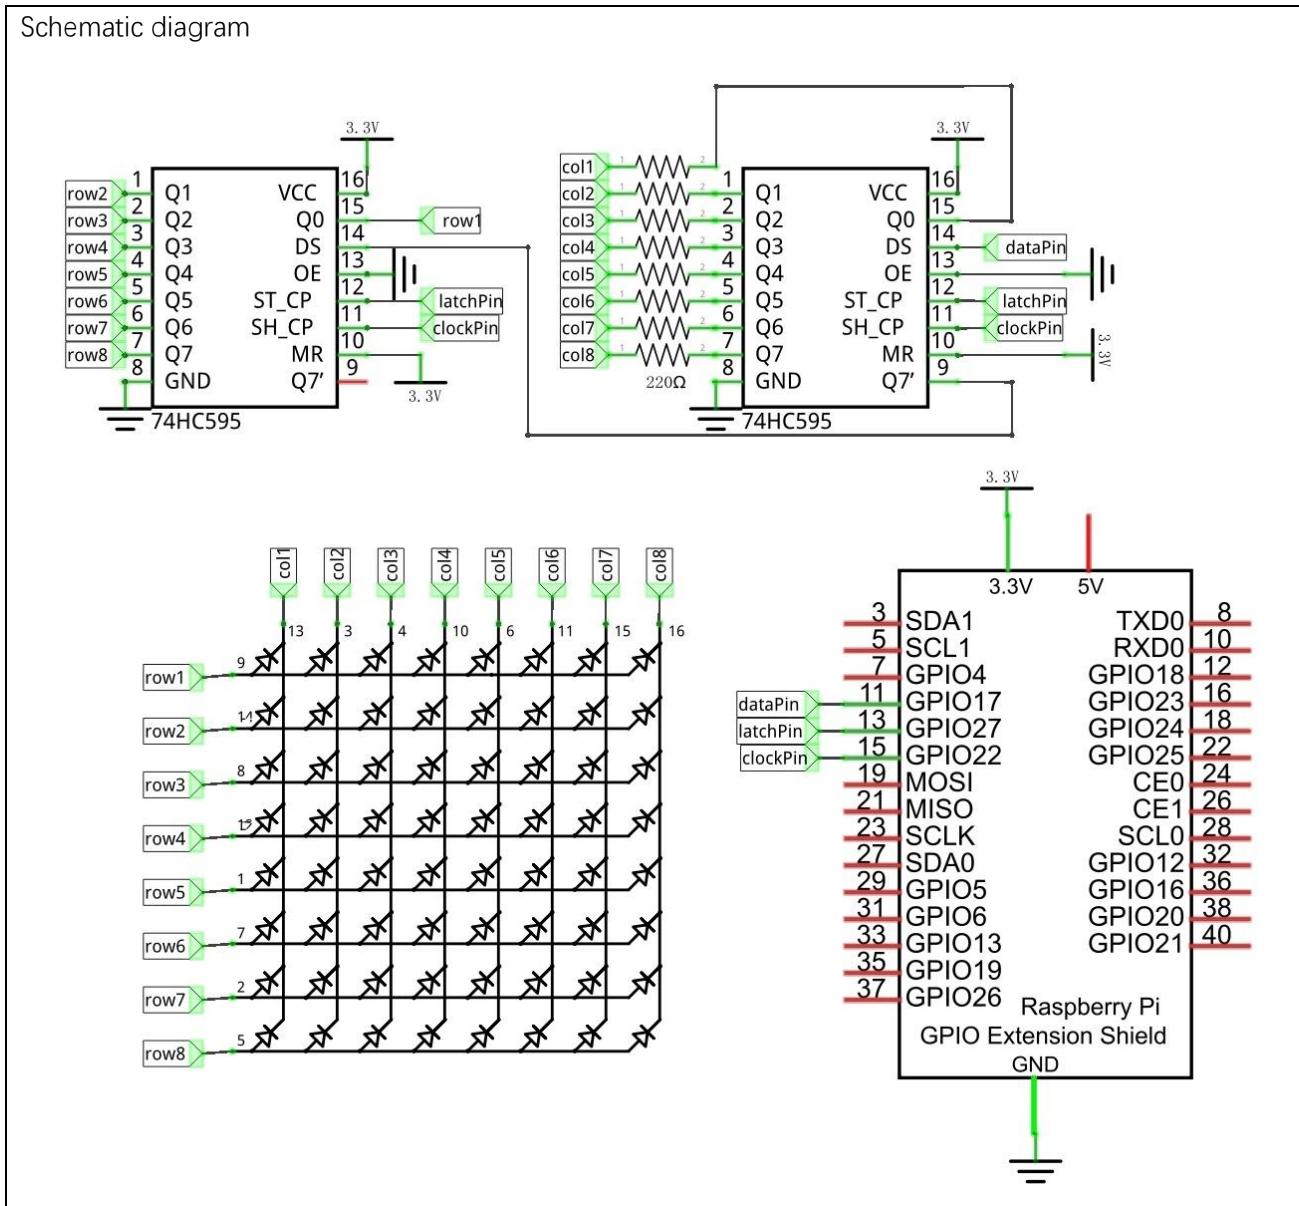

To begin, display the first column, then turn off the first column and display the second column. (and so on) .... turn off the seventh column and display the 8th column, and then start the process over from the first column again like the control of LED Bar Graph project. The whole process will be repeated rapidly in a loop. Due to the principle of optical afterglow effect and the vision persistence effect in human sight, we will see a picture of a smiling face directly rather than individual columns of LEDs turned ON one column at a time (although in fact this is the reality we cannot perceive).

Scanning rows is another option to display on an LED Matrix (dot matrix grid). Whether scanning by row or column, 16 GPIO is required. In order to save GPIO ports of control board, two 74HC595 IC Chips are used in the circuit. Every 74HC595 IC Chip has eight parallel output ports, so two of these have a combined total of 16 ports, which is just enough for our project. The control lines and data lines of the two 74HC595 IC Chips are not all connected to the RPi, but connect to the Q7 pin of first stage 74HC595 IC Chip and to the data pin of second IC Chip. The two 74HC595 IC Chips are connected in series, which is the same as using one "74HC595 IC Chip" with 16 parallel output ports.

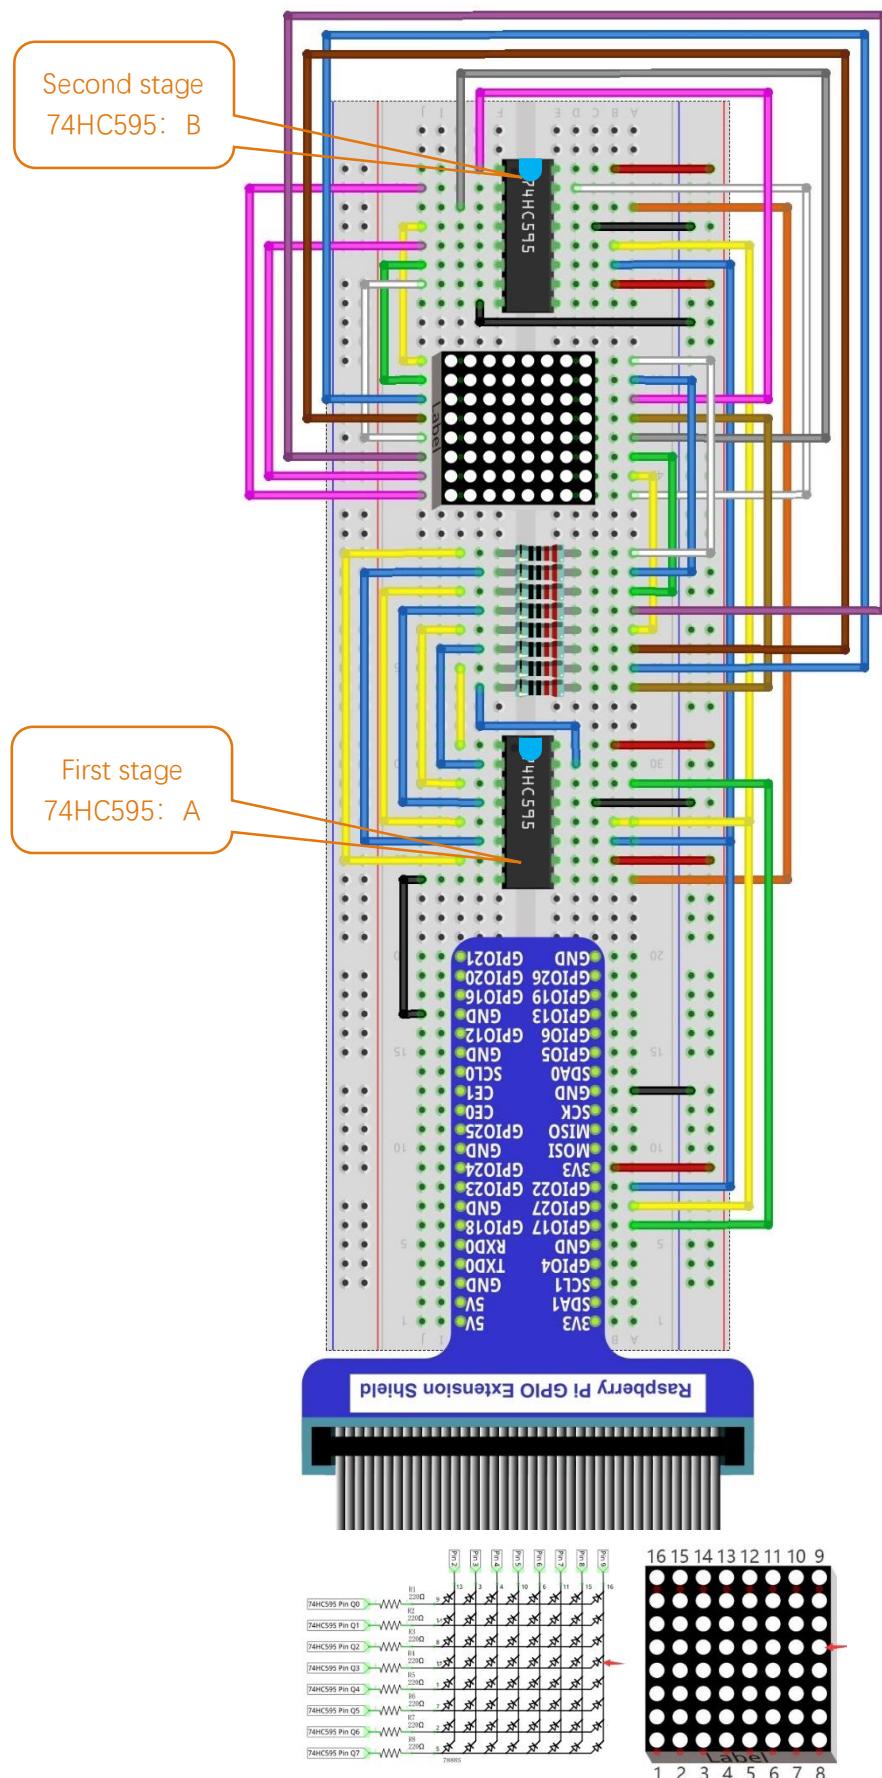

## Circuit

In circuit of this project, the power pin of the 74HC595 IC Chip is connected to 3.3V. It can also be connected to 5V to make LED Matrix brighter.

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

Two 74HC595 IC Chips are used in this project, one for controlling the LED Matrix's columns and the other for controlling the rows. According to the circuit connection, row data should be sent first, then column data. The following code will make the LED Matrix display a smiling face, and then display characters "0 to F" scrolling in a loop on the LED Matrix.

### C Code 19.1.1 LEDMatrix

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 19.1.1\_LEDMatrix directory of C language.

```
cd ~/Freenove_Kit/Code/C_Code/19.1.1_LEDMatrix
```

2. Use following command to compile "LEDMatrix.c" and generate executable file "LEDMatrix".

```
gcc LEDMatrix.c -o LEDMatrix -lwiringPi
```

3. Then run the generated file "LEDMatrix".

```
sudo ./LEDMatrix
```

After the program is executed, the LED Matrix display a smiling face, and then display characters "0 to F" scrolling in a loop on the LED Matrix.

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <wiringShift.h>
4
5 #define  dataPin  0 //DS Pin of 74HC595(Pin14)
6 #define  latchPin 2 //ST_CP Pin of 74HC595(Pin12)
7 #define  clockPin 3 //SH_CP Pin of 74HC595(Pin11)
8 // data of smile face
9 unsigned char pic[]={0x1c,0x22,0x51,0x45,0x45,0x51,0x22,0x1c} ;
10 unsigned char data[]={ // data of "0-F"
11     0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, // "
12     0x00, 0x00, 0x3E, 0x41, 0x41, 0x3E, 0x00, 0x00, // "0"
13     0x00, 0x00, 0x21, 0x7F, 0x01, 0x00, 0x00, 0x00, // "1"
14     0x00, 0x00, 0x23, 0x45, 0x49, 0x31, 0x00, 0x00, // "2"
15     0x00, 0x00, 0x22, 0x49, 0x49, 0x36, 0x00, 0x00, // "3"
16     0x00, 0x00, 0x0E, 0x32, 0x7F, 0x02, 0x00, 0x00, // "4"
17     0x00, 0x00, 0x79, 0x49, 0x49, 0x46, 0x00, 0x00, // "5"
18     0x00, 0x00, 0x3E, 0x49, 0x49, 0x26, 0x00, 0x00, // "6"
19     0x00, 0x00, 0x60, 0x47, 0x48, 0x70, 0x00, 0x00, // "7"
20     0x00, 0x00, 0x36, 0x49, 0x49, 0x36, 0x00, 0x00, // "8"
21     0x00, 0x00, 0x32, 0x49, 0x49, 0x3E, 0x00, 0x00, // "9"
22     0x00, 0x00, 0x3F, 0x44, 0x44, 0x3F, 0x00, 0x00, // "A"
23     0x00, 0x00, 0x7F, 0x49, 0x49, 0x36, 0x00, 0x00, // "B"
24     0x00, 0x00, 0x3E, 0x41, 0x41, 0x22, 0x00, 0x00, // "C"
25     0x00, 0x00, 0x7F, 0x41, 0x41, 0x3E, 0x00, 0x00, // "D"
```

```
26     0x00, 0x00, 0x7F, 0x49, 0x49, 0x41, 0x00, 0x00, // "E"
27     0x00, 0x00, 0x7F, 0x48, 0x48, 0x40, 0x00, 0x00, // "F"
28     0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, // "
29 };
30 void _shiftOut(int dPin, int cPin, int order, int val) {
31     int i;
32     for(i = 0; i < 8; i++) {
33         digitalWrite(cPin, LOW);
34         if(order == LSBFIRST) {
35             digitalWrite(dPin, ((0x01&(val>>i)) == 0x01) ? HIGH : LOW);
36             delayMicroseconds(10);
37         }
38         else {//if(order == MSBFIRST) {
39             digitalWrite(dPin, ((0x80&(val<<i)) == 0x80) ? HIGH : LOW);
40             delayMicroseconds(10);
41         }
42         digitalWrite(cPin, HIGH);
43         delayMicroseconds(10);
44     }
45 }
46 int main(void)
47 {
48     int i, j, k;
49     unsigned char x;
50
51     printf("Program is starting ... \n");
52
53     wiringPiSetup();
54
55     pinMode(dataPin, OUTPUT);
56     pinMode(latchPin, OUTPUT);
57     pinMode(clockPin, OUTPUT);
58     while(1) {
59         for(j=0; j<500; j++) { //Repeat enough times to display the smiling face a period of
time
60             x=0x80;
61             for(i=0; i<8; i++) {
62                 digitalWrite(latchPin, LOW);
63                 _shiftOut(dataPin, clockPin, MSBFIRST, pic[i]); // first shift data of line
information to the first stage 74HC95
64                 _shiftOut(dataPin, clockPin, MSBFIRST, ~x); //then shift data of column
information to the second stage 74HC95
65
66             digitalWrite(latchPin, HIGH); //Output data of two stage 74HC595 at the same
```

```

time
67         x>>=1;    //display the next column
68         delay(1);
69     }
70 }
71 for(k=0;k<sizeof(data)-8;k++) { //sizeof(data) total number of "0-F" columns
72     for(j=0;j<20;j++) { //times of repeated displaying LEDMatrix in every frame, the
bigger the "j" , the longer the display time
73         x=0x80;           //Set the column information to start from the first column
74         for(i=k;i<8+k;i++) {
75             digitalWrite(latchPin,LOW);
76             _shiftOut(dataPin,clockPin,MSBFIRST,data[i]);
77             _shiftOut(dataPin,clockPin,MSBFIRST,^x);
78             digitalWrite(latchPin,HIGH);
79             x>>=1;
80             delay(1);
81         }
82     }
83 }
84 }
85 }
86 return 0;
87 }

```

The first “for” loop in the “while” loop is used to display a static smile. Displaying column information from left to right, one column at a time with a total of 8 columns. This repeats 500 times to ensure sufficient display time.

```

time
for(j=0;j<500;j++) {// Repeat enough times to display the smiling face a period of
time
x=0x80;
for(i=0;i<8;i++) {
digitalWrite(latchPin,LOW);
shiftOut(dataPin,clockPin,MSBFIRST,pic[i]);
shiftOut(dataPin,clockPin,MSBFIRST,^x);
digitalWrite(latchPin,HIGH);
x>>=1;
delay(1);
}
}

```

The second “for” loop is used to display scrolling characters "0 to F", for a total of  $18 \times 8 = 144$  columns. Displaying the 0-8 column, then the 1-9 column, then the 2-10 column..... and so on...138-144 column in consecutively to achieve the scrolling effect. The display of each frame is repeated a certain number of times and the more repetitions, the longer the single frame display will be and the slower the scrolling movement.

```
for(k=0;k<sizeof(data)-8;k++) { //sizeof(data) total number of "0-F" columns
    for(j=0;j<20;j++) {// times of repeated displaying LEDMatrix in every frame, the
        bigger the "j" , the longer the display time
            x=0x80; // Set the column information to start from the first column
            for(i=k;i<8+k;i++) {
                digitalWrite(latchPin,LOW);
                shiftOut(dataPin,clockPin,MSBFIRST,data[i]);
                shiftOut(dataPin,clockPin,MSBFIRST,^x);
                digitalWrite(latchPin,HIGH);
                x>>=1;
                delay(1);
            }
        }
    }
}
```

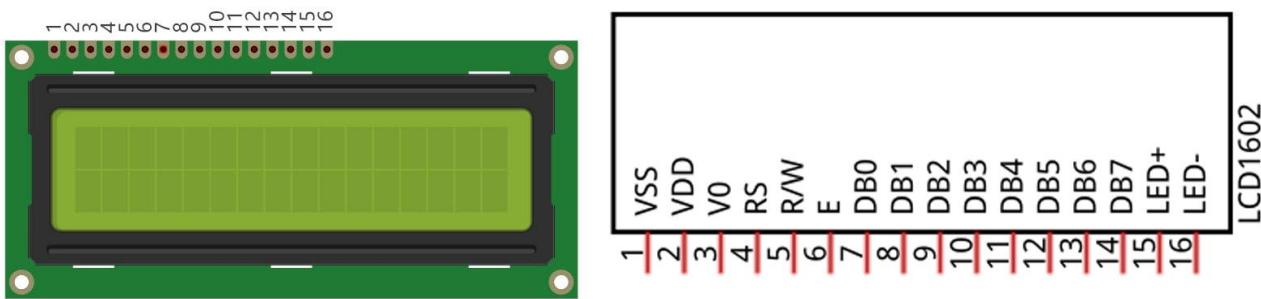

# Chapter 20 LCD1602

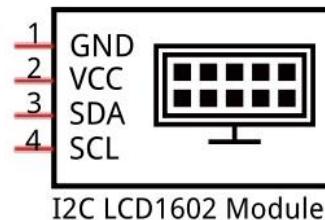

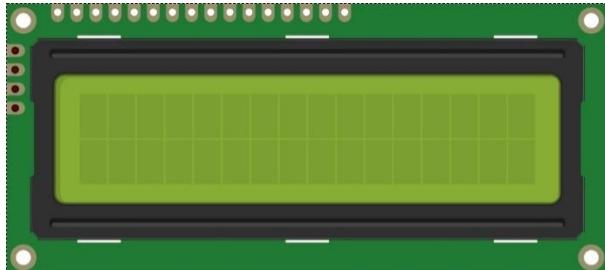

In this chapter, we will learn about the LCD1602 Display Screen,

## Project 20.1 I2C LCD1602

There are LCD1602 display screen and the I2C LCD. We will introduce both of them in this chapter. But what we use in this project is an I2C LCD1602 display screen. The LCD1602 Display Screen can display 2 lines of characters in 16 columns. It is capable of displaying numbers, letters, symbols, ASCII code and so on. As shown below is a monochrome LCD1602 Display Screen along with its circuit pin diagram

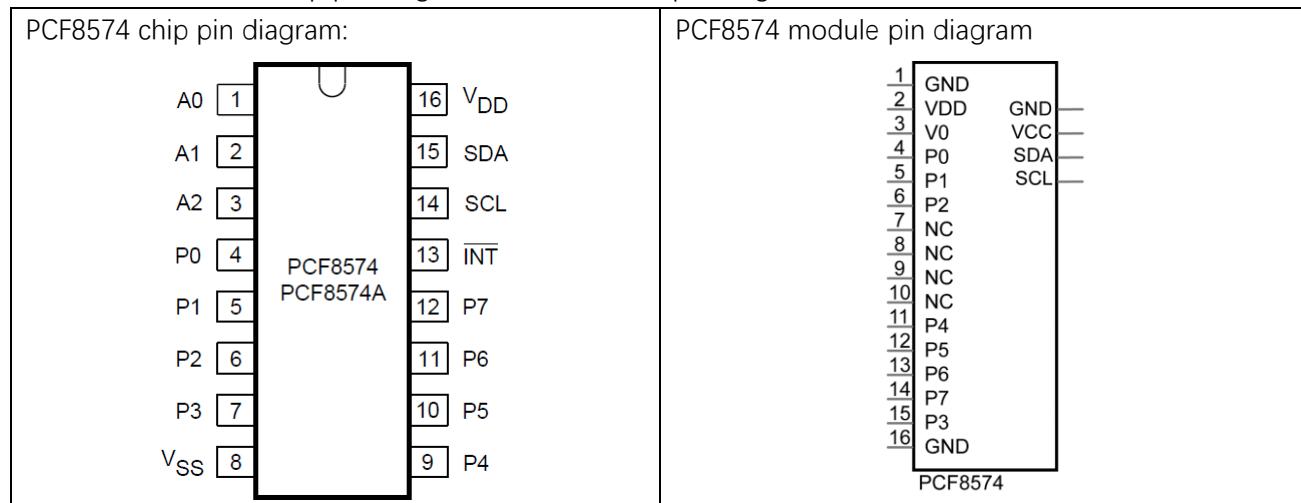

I2C LCD1602 Display Screen integrates a I2C interface, which connects the serial-input & parallel-output module to the LCD1602 Display Screen. This allows us to only use 4 lines to operate the LCD1602.

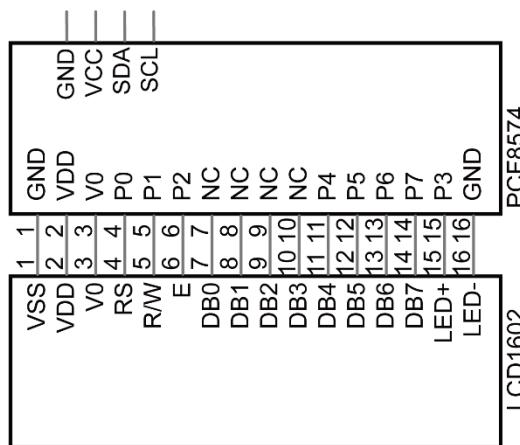

The serial-to-parallel IC chip used in this module is PCF8574T (PCF8574AT), and its default I2C address is 0x27(0x3F). You can also view the RPI bus on your I2C device address through command "i2cdetect -y 1" (refer to the "configuration I2C" section below).

Below is the PCF8574 chip pin diagram and its module pin diagram:

PCF8574 module pins and LCD1602 pins correspond to each other and connected to each other:

Because of this, as stated earlier, we only need 4 pins to control the 16 pins of the LCD1602 Display Screen through the I<sub>2</sub>C interface.

In this project, we will use the I<sub>2</sub>C LCD1602 to display some static characters and dynamic variables.

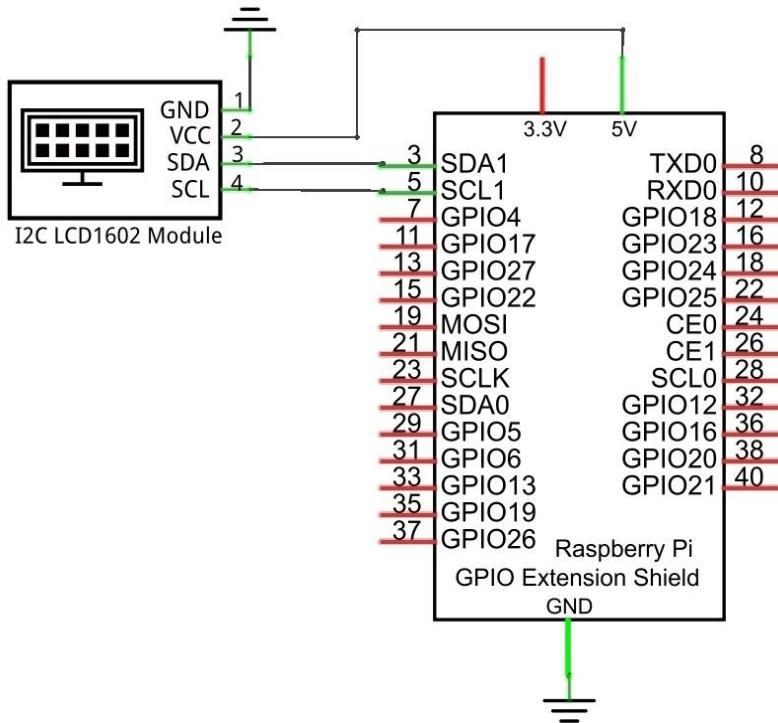

## Component List

Raspberry Pi (with 40 GPIO) x1	Jumper Wire x4
GPIO Extension Board & Ribbon Cable x1	
Breadboard x1	
I <sub>2</sub> C LCD1602 Module x1	

## Circuit

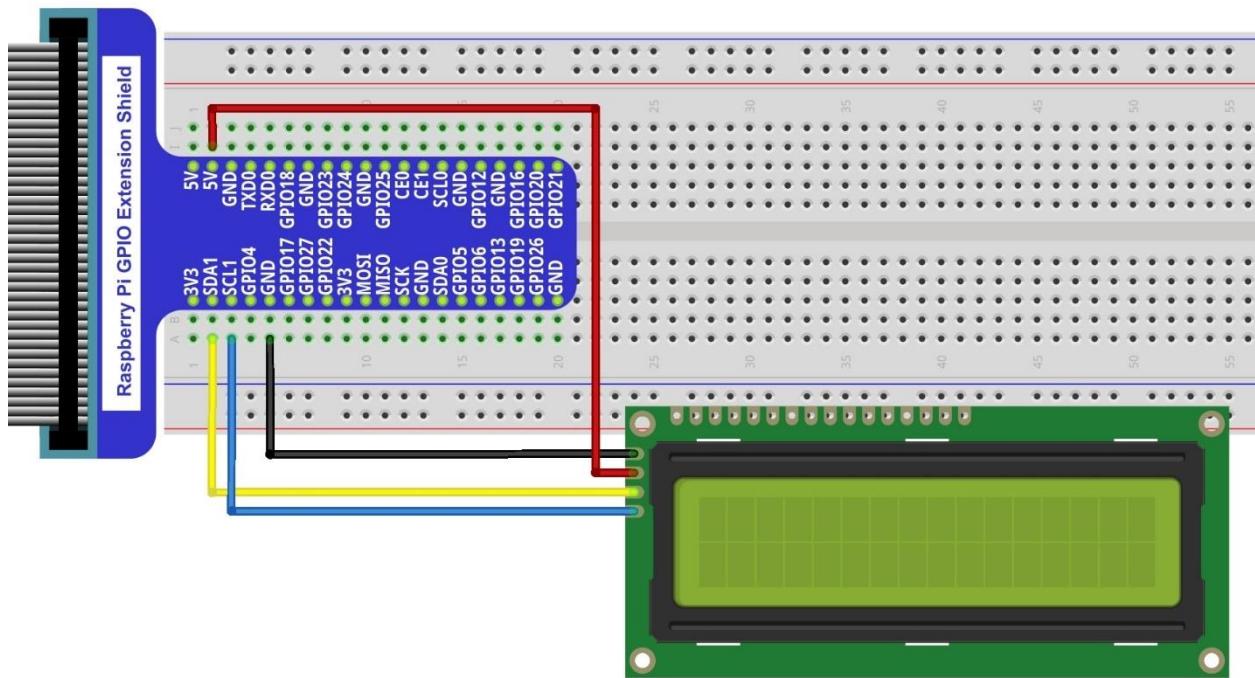

Note that the power supply for I2C LCD1602 in this circuit is 5V.

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

**NOTE: It is necessary to configure I2C and install Smbus first (see [chapter 7](#) for details)**

## Code

This code will have your RPi's CPU temperature and System Time Displayed on the LCD1602.

### C Code 20.1.1 I2CLCD1602

If you did not [configure I2C and install Smbus](#), please refer to [Chapter 7](#). If you did, please continue.

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 20.1.1\_I2CLCD1602 directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/20.1.1_I2CLCD1602
```

2. Use following command to compile "I2CLCD1602.c" and generate executable file "I2CLCD1602".

```
gcc I2CLCD1602.c -o I2CLCD1602 -lwiringPi -lwiringPiDev
```

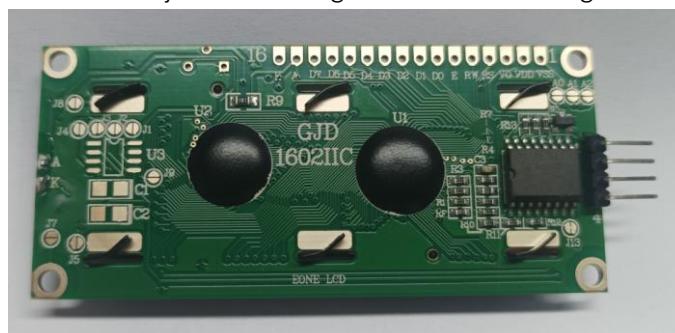

3. Then run the generated file "I2CLCD1602".

```
sudo ./I2CLCD1602
```

After the program is executed, the LCD1602 Screen will display your RPi's CPU Temperature and System Time.

So far, at this writing, we have two types of LCD1602 on sale. One needs to adjust the backlight, and the other does not.

The LCD1602 that does not need to adjust the backlight is shown in the figure below.

If the LCD1602 you received is the following one, and you cannot see anything on the display or the display is not clear, try rotating the white knob on back of LCD1602 slowly, which adjusts the contrast, until the screen can display clearly.

The following is the program code:

```

1 #include <stdlib.h>
2 #include <stdio.h>
3 #include <wiringPi.h>
4 #include <wiringPiI2C.h>
5 #include <pcf8574.h>
```

```
6 #include <lcd.h>
7 #include <time.h>
8
9 int pcf8574_address = 0x27;           // PCF8574T:0x27, PCF8574AT:0x3F
10 #define BASE 64          // BASE any number above 64
11 //Define the output pins of the PCF8574, which are directly connected to the LCD1602 pin.
12 #define RS      BASE+0
13 #define RW      BASE+1
14 #define EN      BASE+2
15 #define LED     BASE+3
16 #define D4      BASE+4
17 #define D5      BASE+5
18 #define D6      BASE+6
19 #define D7      BASE+7
20
21 int lcdhd;// used to handle LCD
22 void printCPUtemperature(){// sub function used to print CPU temperature
23     FILE *fp;
24     char str_temp[15];
25     float CPU_temp;
26     // CPU temperature data is stored in this directory.
27     fp=fopen("/sys/class/thermal/thermal_zone0/temp","r");
28     fgets(str_temp,15,fp);      // read file temp
29     CPU_temp = atof(str_temp)/1000.0; // convert to Celsius degrees
30     printf("CPU's temperature : %.2f \n",CPU_temp);
31     lcdPosition(lcdhd,0,0);    // set the LCD cursor position to (0,0)
32     lcdPrintf(lcdhd,"CPU:%.2fC",CPU_temp);// Display CPU temperature on LCD
33     fclose(fp);
34 }
35 void printDataTime()//used to print system time
36     time_t rawtime;
37     struct tm *timeinfo;
38     time(&rawtime);// get system time
39     timeinfo = localtime(&rawtime); //convert to local time
40     printf("%s \n",asctime(timeinfo));
41     lcdPosition(lcdhd,0,1); // set the LCD cursor position to (0,1)
42
43 lcdPrintf(lcdhd,"Time:%02d:%02d:%02d",timeinfo->tm_hour,timeinfo->tm_min,timeinfo->tm_sec);
44 //Display system time on LCD
45 }
46 int detectI2C(int addr){ //Used to detect i2c address of LCD
47     int _fd = wiringPiI2CSetup (addr);
48     if (_fd < 0){
49         printf("Error address : 0x%x \n",addr);
```

```
50         return 0 ;
51     }
52     else{
53         if(wiringPiI2CWrite(_fd, 0) < 0){
54             printf("Not found device in address 0x%x \n",addr);
55             return 0;
56         }
57         else{
58             printf("Found device in address 0x%x \n",addr);
59             return 1 ;
60         }
61     }
62 }
63 int main(void){
64     int i;
65     printf("Program is starting ... \n");
66     wiringPiSetup();
67     if(detectI2C(0x27)){
68         pcf8574_address = 0x27;
69     }else if(detectI2C(0x3F)){
70         pcf8574_address = 0x3F;
71     }else{
72         printf("No correct I2C address found, \n"
73             "Please use command 'i2cdetect -y 1' to check the I2C address! \n"
74             "Program Exit. \n");
75         return -1;
76     }
77     pcf8574Setup(BASE,pcf8574_address);//initialize PCF8574
78     for(i=0;i<8;i++){
79         pinMode(BASE+i,OUTPUT);      //set PCF8574 port to output mode
80     }
81     digitalWrite(LED,HIGH);      //turn on LCD backlight
82     digitalWrite(RW,LOW);        //allow writing to LCD
83     lcdhd = lcdInit(2,16,4,RS,EN,D4,D5,D6,D7,0,0,0,0); // initialize LCD and return "handle"
used to handle LCD
84     if(lcdhd == -1){
85         printf("lcdInit failed !");
86         return 1;
87     }
88     while(1){
89         printCPUTemperature(); //print CPU temperature
90         printDataTime();      // print system time
91         delay(1000);
92     }
```

```

93     return 0;
94 }
```

From the code, we can see that the PCF8591 and the PCF8574 have many similarities in using the I2C interface to expand the GPIO RPI.

First, define the I2C address of the PCF8574 and the Extension of the GPIO pin, which is connected to the GPIO pin of the LCD1602. LCD1602 has two different i2c addresses. Set 0x27 as default.

```

int pcf8574_address = 0x27;           // PCF8574T:0x27, PCF8574AT:0x3F
#define BASE 64                  // BASE any number above 64
//Define the output pins of the PCF8574, which are directly connected to the LCD1602 pin.
#define RS      BASE+0
#define RW      BASE+1
#define EN      BASE+2
#define LED     BASE+3
#define D4      BASE+4
#define D5      BASE+5
#define D6      BASE+6
#define D7      BASE+7
```

Then, in main function, initialize the PCF8574, set all the pins to output mode, and turn ON the LCD1602 backlight (without the backlight the Display is difficult to read).

```

pcf8574Setup(BASE, pcf8574_address); // initialize PCF8574
for(i=0;i<8;i++) {
    pinMode(BASE+i, OUTPUT); // set PCF8574 port to output mode
}
digitalWrite(LED, HIGH); // turn on LCD backlight
```

Then use `lcdInit()` to initialize LCD1602 and set the `RW` pin of LCD1602 to 0 (can be written) according to requirements of this function. The return value of the function called "Handle" is used to handle LCD1602".

```

lcdhd = lcdInit(2, 16, 4, RS, EN, D4, D5, D6, D7, 0, 0, 0, 0); // initialize LCD and return
"handle" used to handle LCD
```

Details about `lcdInit()`:

```

int lcdInit (int rows, int cols, int bits, int rs, int strb,
            int d0, int d1, int d2, int d3, int d4, int d5, int d6, int d7);
```

This is the main initialization function and must be executed first before you use any other LCD functions.

**Rows** and **cols** are the rows and columns of the Display (e.g. 2, 16 or 4, 20). **Bits** is the number of how wide the number of bits is on the interface (4 or 8). The **rs** and **strb** represent the pin numbers of the Display's RS pin and Strobe (E) pin. The parameters **d0** through **d7** are the pin numbers of the 8 data pins connected from the RPi to the display. Only the first 4 are used if you are running the display in 4-bit mode.

The return value is the 'handle' to be used for all subsequent calls to the lcd library when dealing with that LCD, or -1 to indicate a fault (usually incorrect parameter)

For more details about LCD Library, please refer to: <https://projects.drogon.net/raspberry-pi/wiringpi/lcd-library/>

In the next "while", two subfunctions are called to display the RPi's CPU Temperature and the SystemTime.

First look at subfunction `printCPUTemperature()`. The CPU temperature data is stored in the `"/sys/class/thermal/thermal_zone0/temp"` file. We need to read the contents of this file, which converts it to

temperature value stored in variable CPU\_temp and uses lcdPrintf() to display it on LCD.

```
void printCPUTemperature() { //subfunction used to print CPU temperature

    FILE *fp;
    char str_temp[15];
    float CPU_temp;
    // CPU temperature data is stored in this directory.
    fp=fopen("/sys/class/thermal/thermal_zone0/temp", "r");
    fgets(str_temp, 15, fp);      // read file temp
    CPU_temp = atof(str_temp)/1000.0; // convert to Celsius degrees
    printf("CPU's temperature : %.2f \n", CPU_temp);
    lcdPosition(lcdhd, 0, 0);     // set the LCD cursor position to (0,0)
    lcdPrintf(lcdhd, "CPU:%.2fC", CPU_temp); // Display CPU temperature on LCD
    fclose(fp);
}
```

Details about lcdPosition() and lcdPrintf():

**lcdPosition (int handle, int x, int y);**

Set the position of the cursor for subsequent text entry.

**lcdPutchar (int handle, uint8\_t data)**
**lcdPuts (int handle, char \*string)**
**lcdPrintf (int handle, char \*message, ...)**

These output a single ASCII character, a string or a formatted string using the usual print formatting commands to display individual characters (it is how you are able to see characters on your computer monitor).

Next is subfunction printDataTime() used to display System Time. First, it gets the Standard Time and stores it into variable Rawtime, and then converts it to the Local Time and stores it into timeinfo, and finally displays the Time information on the LCD1602 Display.

```
void printDataTime() { //used to print system time

    time_t rawtime;
    struct tm *timeinfo;
    time(&rawtime); // get system time
    timeinfo = localtime(&rawtime); // convert to local time
    printf("%s \n", asctime(timeinfo));
    lcdPosition(lcdhd, 0, 1); // set the LCD cursor position to (0,1)
    lcdPrintf(lcdhd, "Time:%d:%d:%d", timeinfo->tm_hour, timeinfo->tm_min, timeinfo->tm_sec);
    //Display system time on LCD
}
```

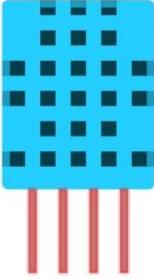

# Chapter 21 Hygrothermograph DHT11

In this chapter, we will learn about a commonly used sensor called a Hygrothermograph DHT11.

## Project 21.1 Hygrothermograph

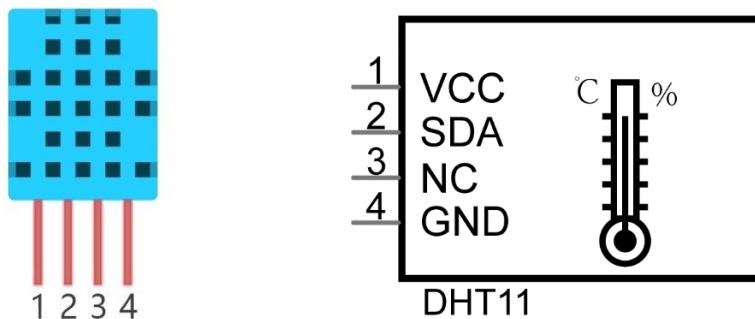

Hygrothermograph is an important tool in our lives to give us data on the temperature and humidity in our environment. In this project, we will use the RPi to read Temperature and Humidity data of the DHT11 Module.

## Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	DHT11 x1 	Resistor 10kΩ x1 
Jumper Wire x4 		

## Component knowledge

The Temperature & Humidity Sensor DHT11 is a compound temperature & humidity sensor, and the output digital signal has been calibrated by its manufacturer.

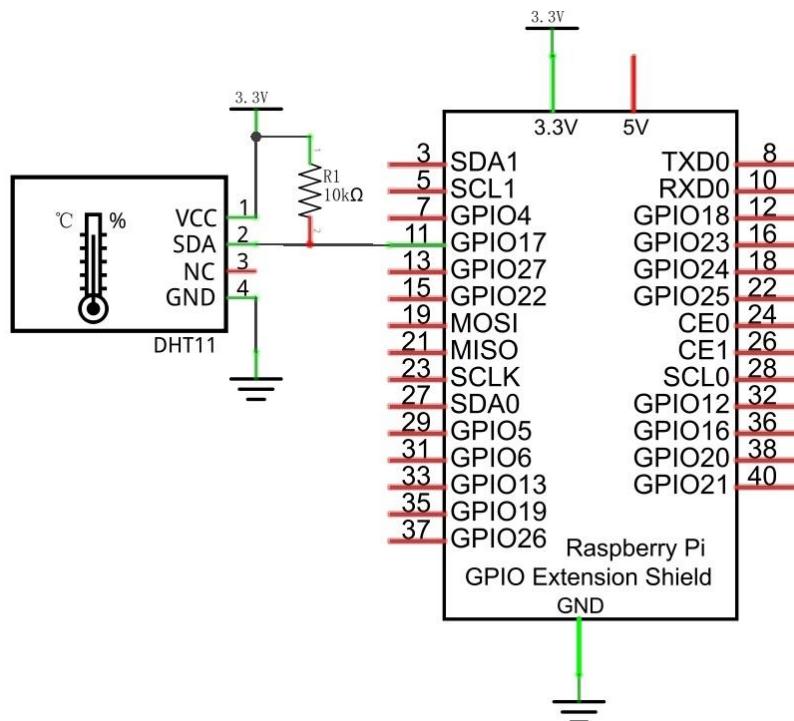

After being powered up, it will initialize in 1 second. Its operating voltage is within the range of 3.3V-5.5V. The SDA pin is a data pin, which is used to communicate with other devices.

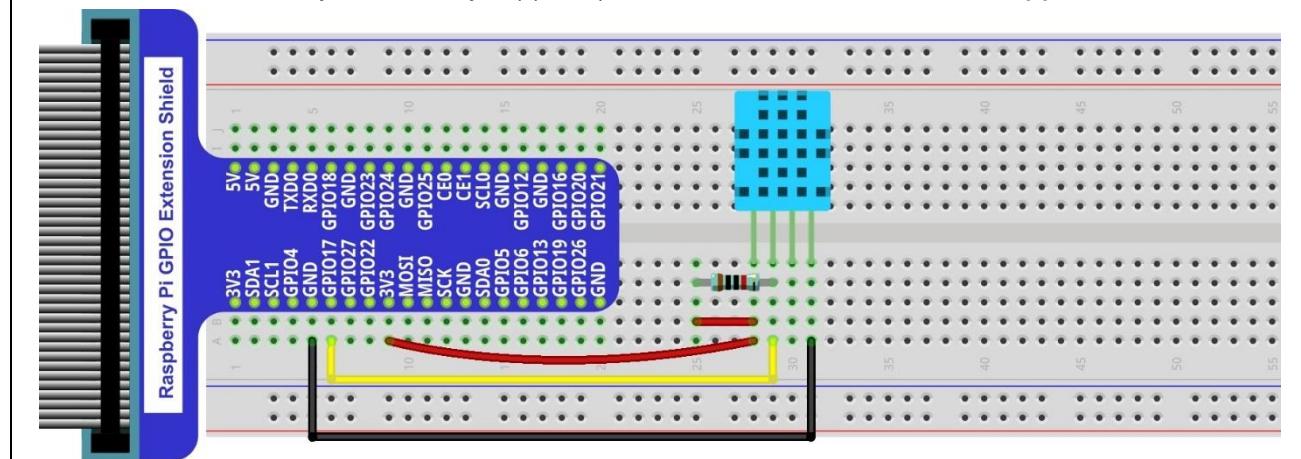

The NC pin (Not Connected Pin) are a type of pin found on various integrated circuit packages. Those pins have no functional purpose to the outside circuit (but may have an unknown functionality during manufacture and test). Those pins **should not be connected** to any of the circuit connections.

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

The code is used to read the temperature and humidity data of DHT11, and display them.

### C Code 21.1.1 DHT11

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter 21.1.1\_DHT11 directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/21.1.1_DHT11
```

2. The code used in this project contains a custom header file. Use the following command to compile the code DHT11.cpp and DHT.cpp and generate executable file DHT11. The custom header file will be compiled at the same time.

```
gcc DHT.cpp DHT11.cpp -o DHT11 -lwiringPi
```

3. Run the generated file "DHT11".

```
sudo ./DHT11
```

After the program is executed, the Terminal window will display the current total number of read times, the read state, as well as temperature and humidity values as is shown below:

```
Measurement counts : 1
DHT11,OK!
Humidity is 50.00 %,      Temperature is 27.50 *C

Measurement counts : 2
DHT11,OK!
Humidity is 53.00 %,      Temperature is 27.50 *C

Measurement counts : 3
DHT11,OK!
Humidity is 54.00 %,      Temperature is 27.50 *C

Measurement counts : 4
DHT11,OK!
Humidity is 54.00 %,      Temperature is 27.50 *C
```

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <stdint.h>
4 #include "DHT.hpp"
5
6 #define DHT11_Pin 0      //define the pin of sensor
7
8 int main() {
9     DHT dht;           //create a DHT class object
10    int chk, counts;   //chk:read the return value of sensor; sumCnt:times of reading
11    sensor
12
13    printf("Program is starting ... \n");
```

```

14     while (1) {
15         counts++; //counting number of reading times
16         printf("Measurement counts : %d \n", counts);
17         for (int i = 0; i < 15; i++) {
18             chk = dht.readDHT11(DHT11_Pin); //read DHT11 and get a return value. Then
determine whether data read is normal according to the return value.
19             if(chk == DHTLIB_OK) {
20                 printf("DHT11,OK! \n");
21                 break;
22             }
23             delay(100);
24         }
25         printf("Humidity is %.2f %%, \t Temperature is %.2f *C\n\n", dht.humidity,
dht.temperature);
26         delay(2000);
27     }
28     return 1;
29 }
30 }
```

In this project code, we use a custom library file "DHT.hpp". It is located in the same directory with the program files "DHT11.cpp" and "DHT.cpp", and methods for reading DHT sensor are provided in the library file. By using this library, we can easily read the DHT Sensor. First, we create a DHT class object in the code.

```
DHT dht;
```

Then in the "while" loop, use `chk = dht.readDHT11 (DHT11_Pin)` to read the DHT11, and determine whether the data read is normal according to the return value "chk". If the value is OK, end for loop and move on. Otherwise, try 15 times in total. Then use variable counts to record number of times to read.

```

while (1) {
    counts++; //counting number of reading times
    printf("Measurement counts : %d \n", counts);
    for (int i = 0; i < 15; i++) {
        chk = dht.readDHT11(DHT11_Pin); //read DHT11 and get a return value. Then
determine whether data read is normal according to the return value.
        if(chk == DHTLIB_OK) {
            printf("DHT11,OK! \n");
            break;
        }
        delay(100);
    }
    printf("Humidity is %.2f %%, \t Temperature is %.2f *C\n\n", dht.humidity,
dht.temperature);
    delay(2000);
}
```

Finally display the results:

```
printf("Humidity is %.2f %%, \t Temperature is %.2f *C\n\n", dht.humidity, dht.temperature);
```

Library file "DHT.hpp" contains a DHT class and this public member function int **readDHT11** (int pin) is used to read sensor DHT11 and store the temperature and humidity data read to member variables double humidity and temperature. The implementation method of the function is included in the file "DHT.cpp".

```
1 #define _DHT_H_
2
3 #include <wiringPi.h>
4 #include <stdio.h>
5 #include <stdint.h>
6
7 //read return flag of sensor
8 #define DHTLIB_OK          0
9 #define DHTLIB_ERROR_CHECKSUM -1
10 #define DHTLIB_ERROR_TIMEOUT -2
11 #define DHTLIB_INVALID_VALUE -999
12
13 #define DHTLIB_DHT11_WAKEUP 20
14 #define DHTLIB_DHT_WAKEUP   1
15
16 #define DHTLIB_TIMEOUT      100
17
18 class DHT{
19     public:
20         DHT();
21         double humidity,temperature;    //use to store temperature and humidity data read
22         int readDHT11Once(int pin);    //read DHT11
23         int readDHT11(int pin);       //read DHT11
24     private:
25         uint8_t bits[5];    //Buffer to receiver data
26         int readSensor(int pin,int wakeupDelay);    //
27
28 };
```

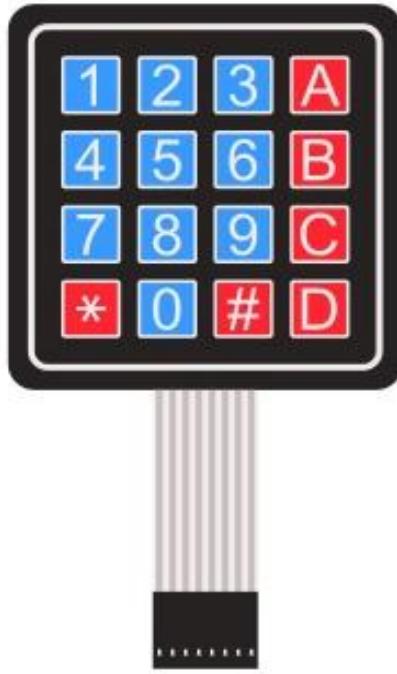

# Chapter 22 Matrix Keypad

Earlier we learned about a single Push Button Switch. In this chapter, we will learn about Matrix Keyboards, which integrates a number of Push Button Switches as Keys for the purposes of Input.

## Project 22.1 Matrix Keypad

In this project, we will attempt to get every key code on the Matrix Keypad to work.

## Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Wire x1 Breadboard x1	4x4 Matrix Keypad x1
Jumper wire	
Resistor 10kΩ x4	

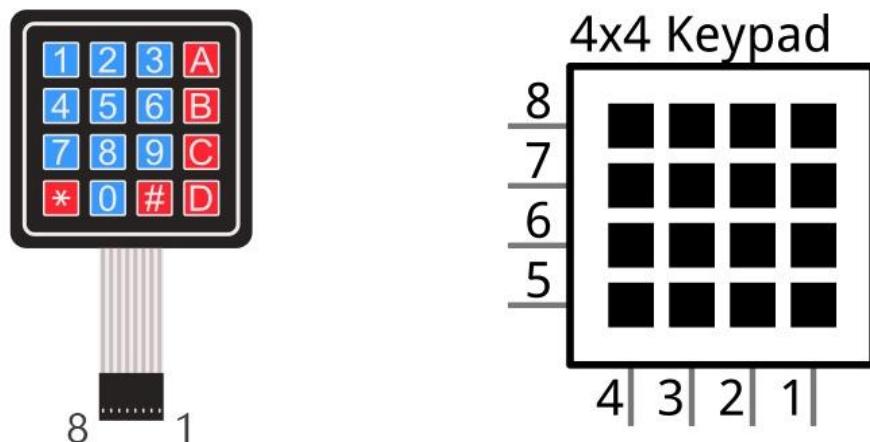

## Component knowledge

### 4x4 Matrix Keypad

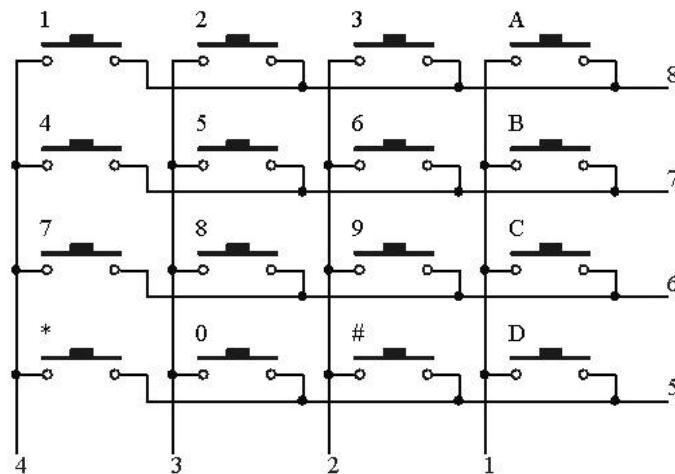

A Keypad Matrix is a device that integrates a number of keys in one package. As is shown below, a 4x4 Keypad

Matrix integrates 16 keys (think of this as 16 Push Button Switches in one module):

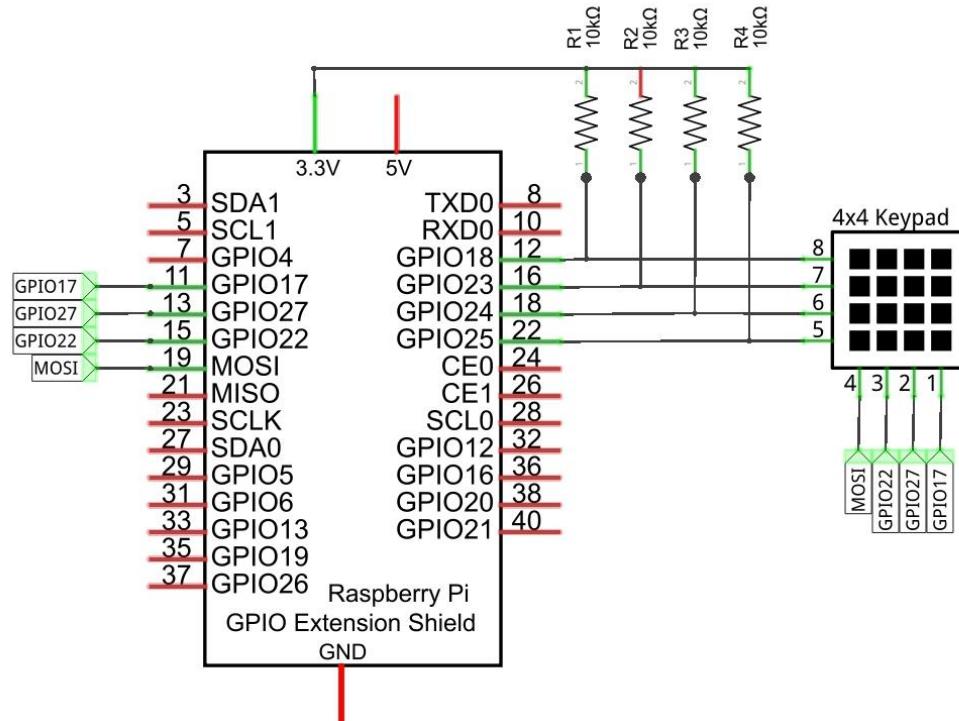

Similar to the integration of an LED Matrix, the 4x4 Keypad Matrix has each row of keys connected with one pin and this is the same for the columns. Such efficient connections reduce the number of processor ports required. The internal circuit of the Keypad Matrix is shown below.

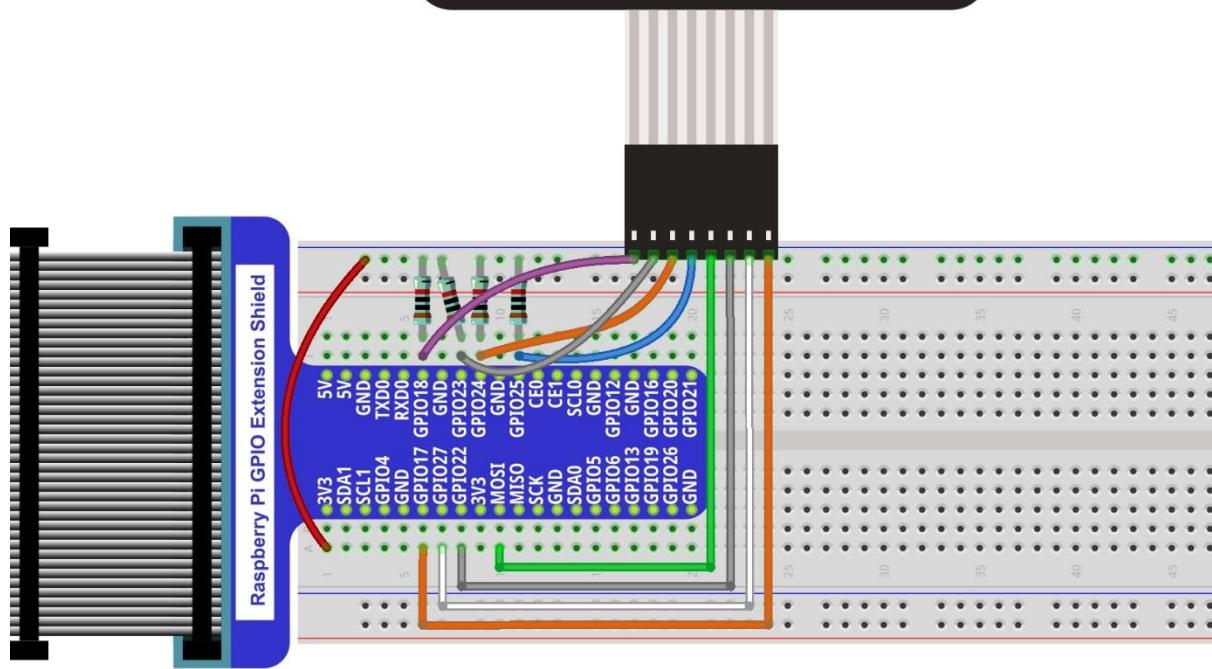

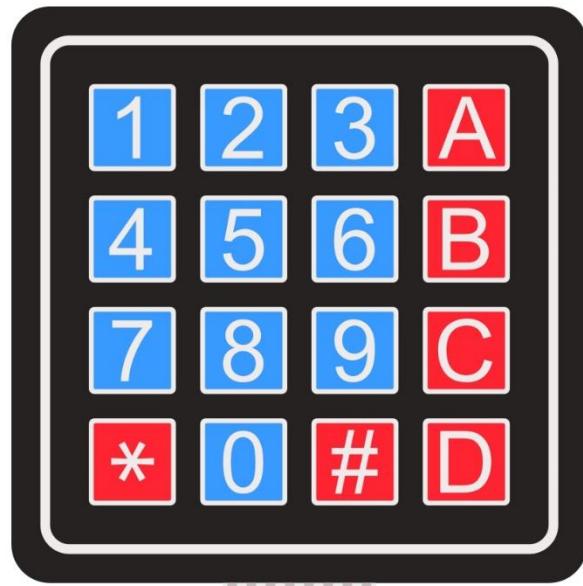

The method of usage is similar to the Matrix LED, by using a row or column scanning method to detect the state of each key's position by column and row. Take column scanning method as an example, send low level to the first 1 column (Pin1), detect level state of row 5, 6, 7, 8 to judge whether the key A, B, C, D are pressed. Then send low level to column 2, 3, 4 in turn to detect whether other keys are pressed. Therefore, you can get the state of all of the keys.

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

This code is used to obtain all key codes of the 4x4 Matrix Keypad, when one of the keys is pressed, the key code will be displayed in the terminal window.

### C Code 22.1.1 MatrixKeypad

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: support@freenove.com

1. Use cd command to enter 22.1.1\_MatrixKeypad directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/22.1.1_MatrixKeypad
```

2. Code of this project contains a custom header file. Use the following command to compile the code MatrixKeypad.cpp, Keypad.cpp and Key.cpp generate executable file MatrixKeypad. The custom header file will be compiled at the same time.

```
gcc MatrixKeypad.cpp Keypad.cpp Key.cpp -o MatrixKeypad -lwiringPi
```

3. Run the generated file "MatrixKeypad".

```
sudo ./MatrixKeypad
```

After the program is executed, pressing any key on the MatrixKeypad, will display the corresponding key code on the Terminal. As is shown below:

```
Program is starting ...
You Pressed key : 1
You Pressed key : 2
You Pressed key : 3
You Pressed key : 4
You Pressed key : 5
You Pressed key : 6
You Pressed key : 7
You Pressed key : 8
You Pressed key : 9
You Pressed key : 0
You Pressed key : A
You Pressed key : B
You Pressed key : C
You Pressed key : D
You Pressed key : *
You Pressed key : #
```

The following is the program code:

```
1 #include "Keypad.hpp"
2 #include <stdio.h>
3 const byte ROWS = 4; //four rows
4 const byte COLS = 4; //four columns
5 char keys[ROWS][COLS] = { //key code
6     {'1','2','3','A'},
7     {'4','5','6','B'},
8     {'7','8','9','C'},
9     {'*','0','#','D'}
10 };
11 byte rowPins[ROWS] = {1, 4, 5, 6 }; //define the row pins for the keypad
12 byte colPins[COLS] = {12,3, 2, 0 }; //define the column pins for the keypad
```

```

13 //create Keypad object
14 Keypad keypad = Keypad( makeKeymap(keys), rowPins, colPins, ROWS, COLS );
15
16 int main() {
17     printf("Program is starting ... \n");
18
19     wiringPiSetup();
20
21     char key = 0;
22     keypad.setDebounceTime(50);
23     while(1) {
24         key = keypad.getKey(); //get the state of keys
25         if (key){ //if a key is pressed, print out its key code
26             printf("You Pressed key : %c \n",key);
27         }
28     }
29     return 1;
30 }
```

In this project code, we use two custom library file "**Keypad.hpp**" and "**Key.hpp**". They are located in the same directory with program files "**MatrixKeypad.cpp**", "**Keypad.cpp**" and "**Key.cpp**". The Library Keypad is "transplanted" from the Arduino Library Keypad. This library file provides a method to read the Matrix Keyboard's input. By using this library, we can easily read the pressed keys of the Matrix Keyboard.

First, we define the information of the Matrix Keyboard used in this project: the number of rows and columns, code designation of each key and GPIO pin connected to each column and row. It is necessary to include the header file "**Keypad.hpp**".

```

#include "Keypad.hpp"
#include <stdio.h>
const byte ROWS = 4; //four rows
const byte COLS = 4; //four columns
char keys[ROWS][COLS] = { //key code
    {'1','2','3','A'},
    {'4','5','6','B'},
    {'7','8','9','C'},
    {'*','0','#','D'}
};
byte rowPins[ROWS] = {1, 4, 5, 6}; //connect to the row pinouts of the keypad
byte colPins[COLS] = {12,3, 2, 0}; //connect to the column pinouts of the keypad
```

Then, based on the above information, initiates a Keypad class object to operate the Matrix Keyboard.

	Keypad keypad = Keypad( makeKeymap(keys), rowPins, colPins, ROWS, COLS );
--	---

Set the debounce time to 50ms, and this value can be set based on the actual characteristics of the keyboard's flexibly, with a default time of 10ms.

	keypad.setDebounceTime(50);
--	-----------------------------

In the "while" loop, use the function `key = keypad.getKey()` to read the keyboard constantly. If there is a key pressed, its key code will be stored in the variable "key", then be displayed.

```
while(1){  
    key = keypad.getKey(); //get the state of keys  
    if (key) { // if a key is pressed, print out its key code  
        printf("You Pressed key : %c \n",key);  
    }  
}
```

The Keypad Library used for the RPi is transplanted from the Arduino Keypad Library. And the source files can be obtained by visiting <http://playground.arduino.cc/Code/Keypad>. As for transplanted function library, the function and method of all classes, functions, variables, etc. are the same as the original library. Partial contents of the Keypad library are described below:

### class Keypad

```
Keypad(char *userKeymap, byte *row, byte *col, byte numRows, byte numCols);
```

Constructor, the parameters are: key code of keyboard, row pin, column pin, the number of rows, the number of columns.

```
char getKey();
```

Get the key code of the pressed key. If no key is pressed, the return value is NULL.

```
void setDebounceTime(uint);
```

Set the debounce time. And the default time is 10ms.

```
void setHoldTime(uint);
```

Set the time when the key holds stable state after pressed.

```
bool isPressed(char keyChar);
```

Judge whether the key with code "keyChar" is pressed.

```
char waitForKey();
```

Wait for a key to be pressed, and return key code of the pressed key.

```
KeyState getState();
```

Get state of the keys.

```
bool keyStateChanged();
```

Judge whether there is a change of key state, then return True or False.

For More information about Keypad, please visit: <http://playground.arduino.cc/Code/Keypad> or through the opening file "Keypad.hpp".

# Chapter 23 Infrared Motion Sensor

In this chapter, we will learn a widely used sensor, Infrared Motion Sensor.

## Project 23.1 PIR Infrared Motion Detector with LED Indicator

In this project, we will make a Motion Detector, with the human body infrared pyroelectric sensors.

When someone is in close proximity to the Motion Detector, it will automatically light up and when there is no one close by, it will be out.

This Infrared Motion Sensor can detect the infrared spectrum (heat signatures) emitted by living humans and animals.

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x5
HC SR501 x1	
	Resistor 220Ω x1

### Component Knowledge

The following is the diagram of the Infrared Motion Sensor (HC SR-501) a PIR Sensor:

Top	Bottom	Schematic
		Infrared Motion Sensor(HC SR501)

Description:

1. Working voltage: 5v-20v(DC) Static current: 65uA.
2. Automatic Trigger. When a living body enters into the active area of sensor, the module will output high

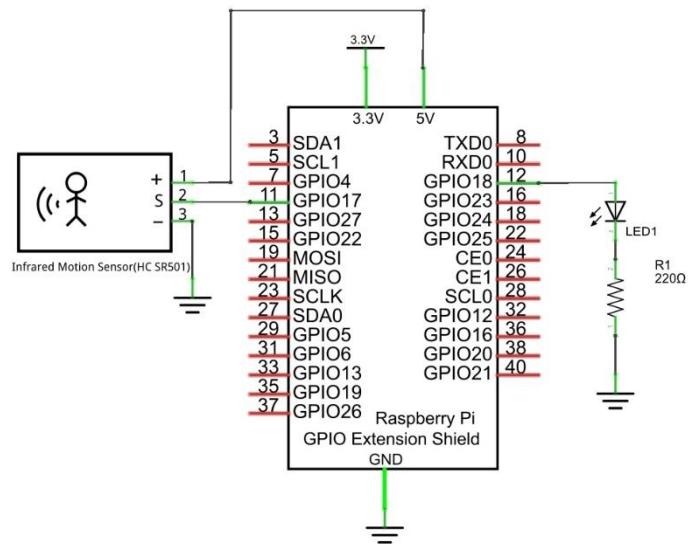

level (3.3V). When the body leaves the sensor's active detection area, it will output high level lasting for time period T, then output low level(0V). Delay time T can be adjusted by the potentiometer R1.

3. Induction block time: the induction will stay in block condition and does not induce external signal at lesser time intervals (less than delay time) after outputting high level or low level
4. Initialization time: the module needs about 1 minute to initialize after being powered ON. During this period, it will alternately output high or low level.
5. One characteristic of this sensor is when a body moves close to or moves away from the sensor's dome edge, the sensor will work at high sensitively. When a body moves close to or moves away from the sensor's dome in a vertical direction (perpendicular to the dome), the sensor cannot detect well (please take note of this deficiency). Actually this makes sense when you consider that this sensor is usually placed on a ceiling as part of a security product. Note: The Sensing Range (distance before a body is detected) is adjusted by the potentiometer.

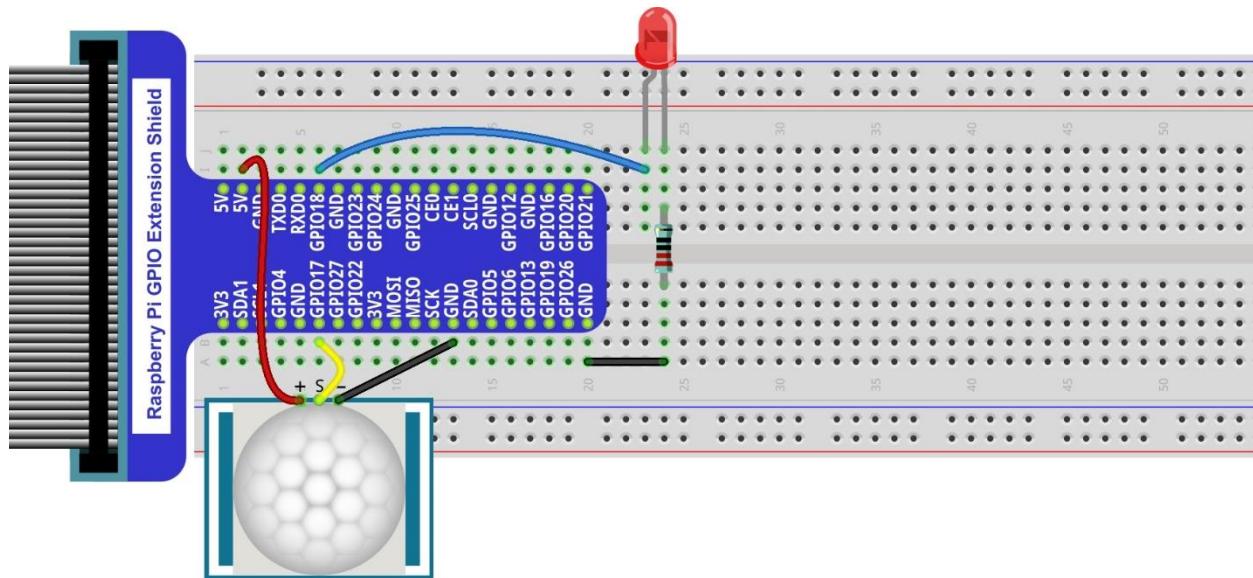

We can regard this sensor as a simple inductive switch when in use.

## Circuit

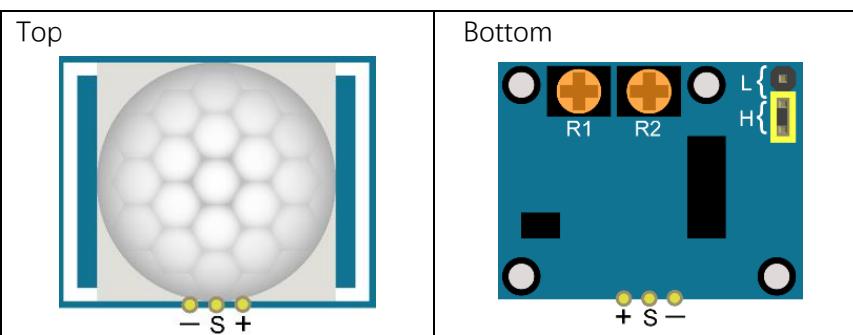

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

### How to use this sensor?

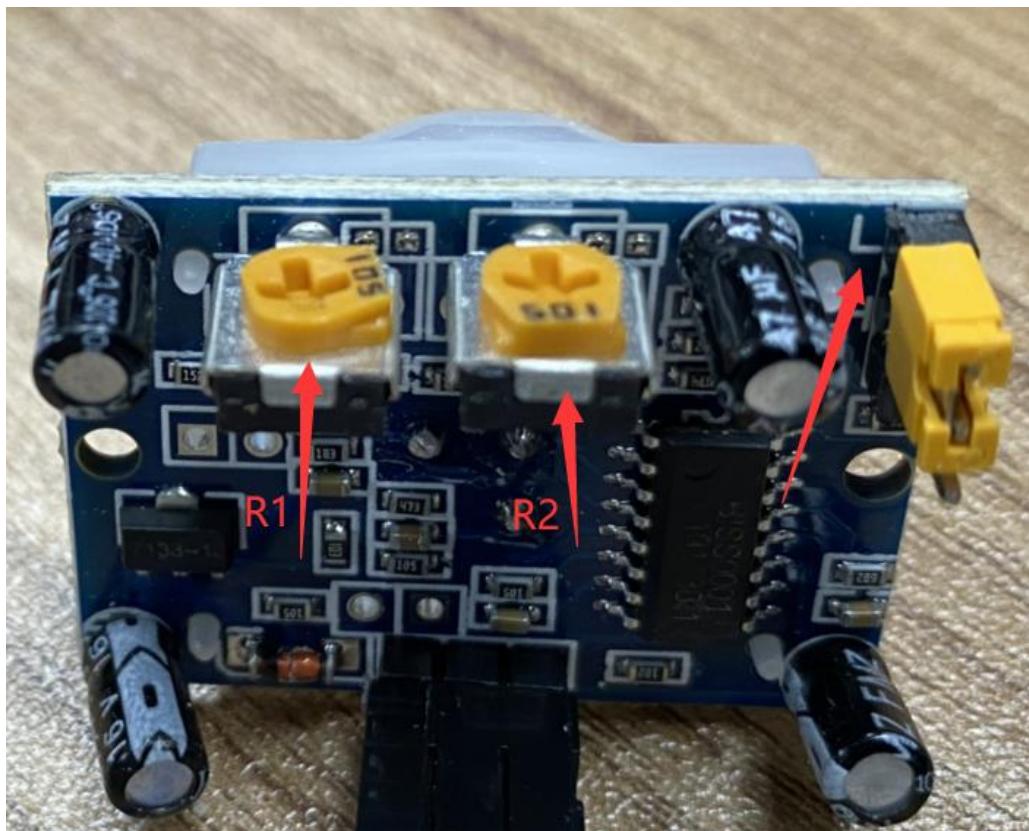

**Description:**

1. You can choose non-repeatable trigger modes or repeatable modes.  
L: non-repeatable trigger mode. The module output high level after sensing a body, then when the delay time is over, the module will output low level. During high level time, the sensor no longer actively senses bodies.  
H: repeatable trigger mode. The distinction from the L mode is that it can sense a body until that body leaves. After this, it starts to time and output low level after delaying T time.
2. R1 is used to adjust HIGH level lasting time when sensor detects human motion, 1.2s-320s.
3. R2 is used to adjust the maximum distance the sensor can detect, 3~5m.

**Here we connect L and adjust R1 and R2 like below to do this project.**

**Put you hand close and away from the sensor slowly. Observe the LED in previous circuit.**

**It need some time between two detections.**

## Code

In this project, we will use the Infrared Motion Sensor to trigger an LED, essentially making the Infrared Motion sensor act as a Motion Switch. Therefore, the code is very similar to the earlier project "Push Button Switch and LED". The difference is that, when Infrared Motion Sensor detects change, it will output high level; when

button is pressed, it will output low level. When the sensor output high level, the LED turns ON, or it will turn OFF.

### C Code 23.1.1 SenseLED

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 23.1.1\_SenseLED directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/23.1.1_SenseLED
```

2. Use following command to compile "SenseLED.c" and generate executable file "SenseLED".

```
gcc SenseLED.c -o SenseLED -lwiringPi
```

3. Run the generated file "SenseLED".

```
sudo ./SenseLED
```

After the program is executed, **wait 1 minute for initialization**. Then move away from or move closer to the Infrared Motion Sensor and observe whether the LED turns ON or OFF. The Terminal window will continuously display the state of LED. As is shown below:

```
led on...
```

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <stdio.h>
3
4 #define ledPin    1 //define the ledPin
5 #define sensorPin 0 //define the sensorPin
6
7 int main(void)
8 {
9     printf("Program is starting ... \n");
10
11     wiringPiSetup();
12
13     pinMode(ledPin, OUTPUT);
14     pinMode(sensorPin, INPUT);
15
16     while(1) {
17
18         if(digitalRead(sensorPin) == HIGH) { //if read value of sensor is HIGH level
19             digitalWrite(ledPin, HIGH); //make led on
20             printf("led turned on >>> \n");
21         }
22         else {
23             digitalWrite(ledPin, LOW); //make led off

```

```
24         printf("led turned off <<< \n");
25     }
26 }
28 return 0;
29 }
```

It can be seen that the code is based on the same principles of the "ButtonLED" code in addition to determining the level of the input signal.

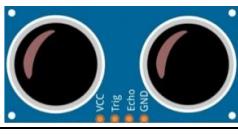

# Chapter 24 Ultrasonic Ranging

In this chapter, we learn a module which use ultrasonic to measure distance.

## Project 24.1 Ultrasonic Ranging

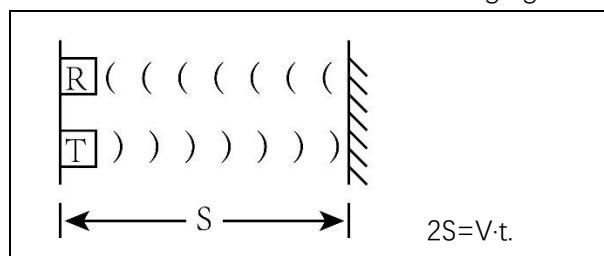

In this project, we use ultrasonic ranging module to measure distance, and print out the data in the terminal.

## Component List

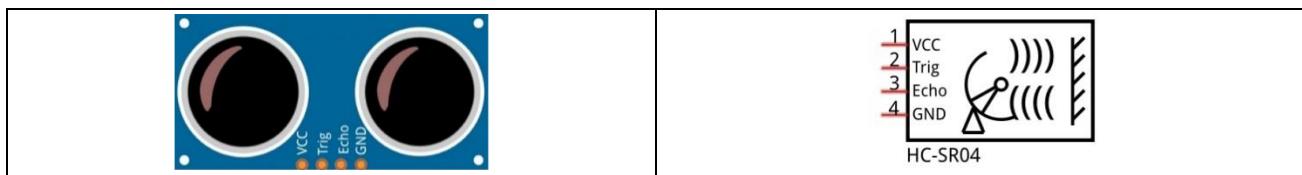

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Ultrasonic Module x1 
Jumper Wire x4 	Resistor 1kΩ x3 

## Component Knowledge

The Ultrasonic Ranging Module uses the principle that ultrasonic waves will be reflected when they encounter any obstacles. This is possible by counting the time interval between when the ultrasonic wave is transmitted to when the ultrasonic wave reflects back after encountering an obstacle. Time interval counting will end after an ultrasonic wave is received, and the time difference (delta) is the total time of the ultrasonic wave's journey from being transmitted to being received. Because the speed of sound in air is a constant, and is about  $v=340\text{m/s}$ , we can calculate the distance between the Ultrasonic Ranging Module and the obstacle:  $s=vt/2$ .

The Ultrasonic Ranging Module integrates a both an ultrasonic transmitter and a receiver. The transmitter is used to convert electrical signals (electrical energy) into high frequency (beyond human hearing) sound waves (mechanical energy) and the function of the receiver is opposite of this. The picture and the diagram of the Ultrasonic Ranging Module are shown below:

Pin description:

VCC	power supply pin
Trig	trigger pin
Echo	Echo pin
GND	GND

### Technical specs:

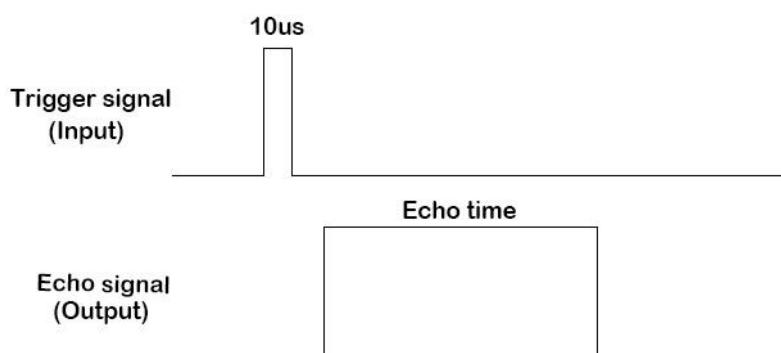

Working voltage: 5V

Working current: 12mA

Minimum measured distance: 2cm

Maximum measured distance: 200cm

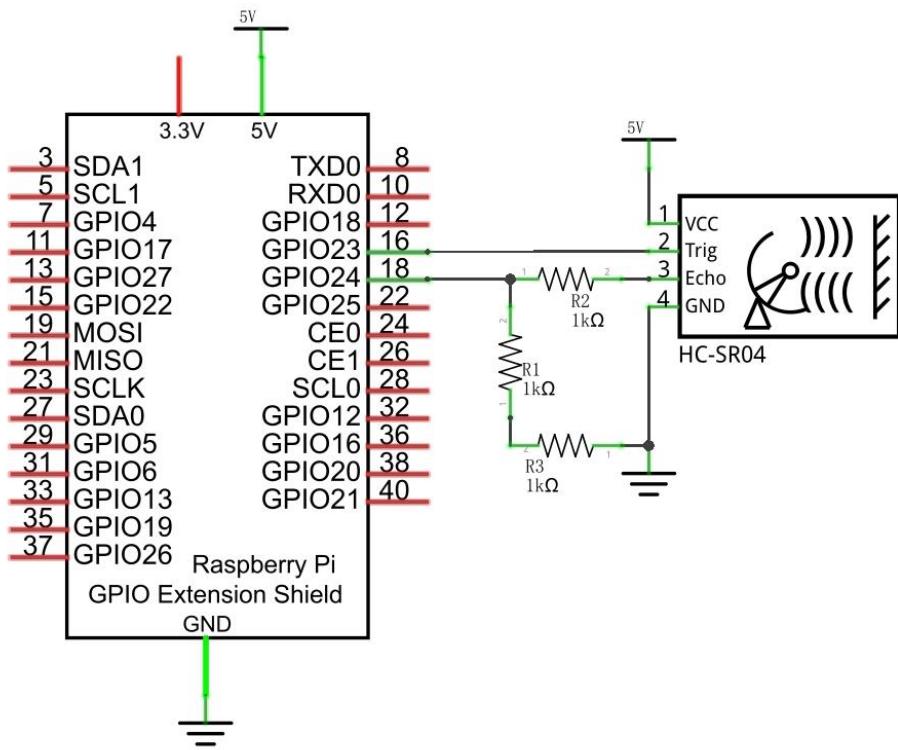

Instructions for Use: output a high-level pulse in Trig pin lasting for least 10uS, the module begins to transmit ultrasonic waves. At the same time, the Echo pin is pulled up. When the module receives the returned ultrasonic waves from encountering an obstacle, the Echo pin will be pulled down. The duration of high level in the Echo pin is the total time of the ultrasonic wave from transmitting to receiving,  $s=vt/2$ . This is done constantly.

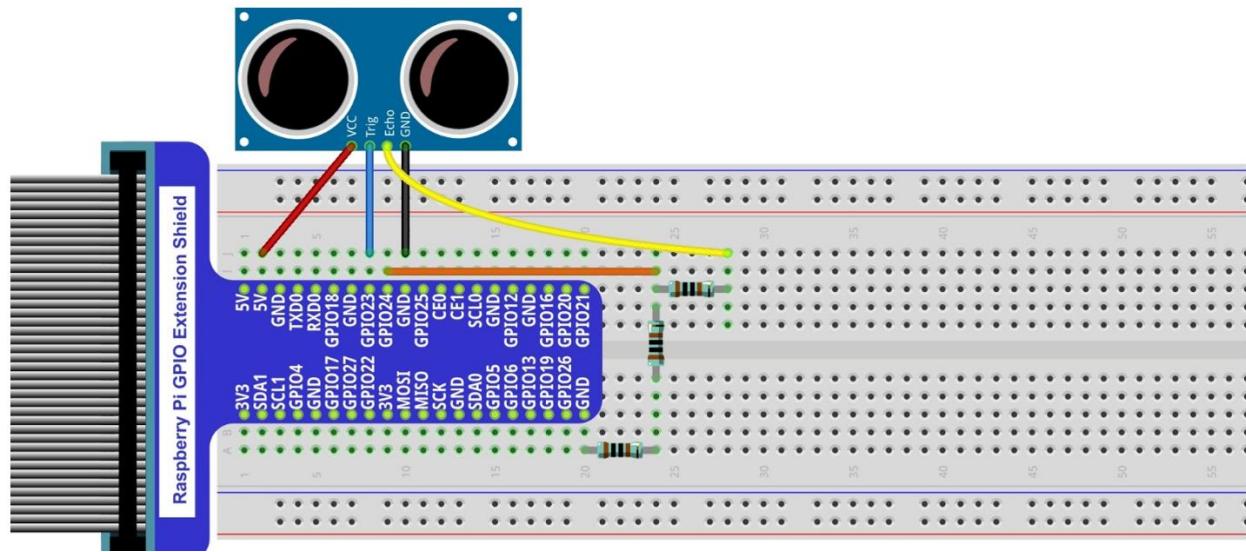

## Circuit

Note that the voltage of ultrasonic module is 5V in this circuit.

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

### C Code 24.1.1 UltrasonicRanging

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: support@freenove.com

1. Use cd command to enter 24.1.1\_UltrasonicRanging directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/24.1.1_UltrasonicRanging
```

2. Use following command to compile "UltrasonicRanging.c" and generate executable file "UltrasonicRanging".

```
gcc UltrasonicRanging.c -o UltrasonicRanging -lwiringPi
```

3. Then run the generated file "UltrasonicRanging".

```
sudo ./UltrasonicRanging
```

After the program is executed, aim the Ultrasonic Ranging Module's detectors ("eyes") perpendicular to the surface of an object (try using your hand). The distance between the ultrasonic module and the object will be displayed in the terminal. As is shown below:

```
The distance is : 198.82 cm
The distance is : 198.37 cm
The distance is : 198.37 cm
The distance is : 199.63 cm
The distance is : 197.52 cm
The distance is : 198.39 cm
The distance is : 198.41 cm
```

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <sys/time.h>
4
5 #define trigPin 4
6 #define echoPin 5
7 #define MAX_DISTANCE 220      // define the maximum measured distance
8 #define timeOut MAX_DISTANCE*60 // calculate timeout according to the maximum measured
distance
9 //function pulseIn: obtain pulse time of a pin
10 int pulseIn(int pin, int level, int timeout);
11 float getSonar(){ //get the measurement result of ultrasonic module with unit: cm
12     long pingTime;
13     float distance;
14     digitalWrite(trigPin,HIGH); //send 10us high level to trigPin
15     delayMicroseconds(10);
16     digitalWrite(trigPin,LOW);
17     pingTime = pulseIn(echoPin,HIGH,timeOut); //read plus time of echoPin
18     distance = (float)pingTime * 340.0 / 2.0 / 10000.0; //calculate distance with sound speed
340m/s
19     return distance;
```

```

20 }
21
22 int main() {
23     printf("Program is starting ... \n");
24
25     wiringPiSetup();
26
27     float distance = 0;
28     pinMode(trigPin, OUTPUT);
29     pinMode(echoPin, INPUT);
30     while(1) {
31         distance = getSonar();
32         printf("The distance is : %.2f cm\n", distance);
33         delay(1000);
34     }
35     return 1;
36 }
```

First, define the pins and the maximum measurement distance.

```

#define trigPin 4
#define echoPin 5
#define MAX_DISTANCE 220           //define the maximum measured distance
```

If the module does not return high level, we cannot wait for this forever, so we need to calculate the time period for the maximum distance, that is, time Out. **timeOut= 2\*MAX\_DISTANCE/100/340\*1000000**. The result of the constant part in this formula is approximately 58.8.

```
#define timeOut MAX_DISTANCE*60
```

Subfunction **getSonar ()** function is used to start the Ultrasonic Module to begin measurements and return the measured distance in cm units. In this function, first let trigPin send 10us high level to start the Ultrasonic Module. Then use **pulseIn ()** to read the Ultrasonic Module and return the duration time of high level. Finally, the measured distance according to the time is calculated.

```

float getSonar(){ // get the measurement results of ultrasonic module, with unit: cm
    long pingTime;
    float distance;
    digitalWrite(trigPin, HIGH); //trigPin send 10us high level
    delayMicroseconds(10);
    digitalWrite(trigPin, LOW);
    pingTime = pulseIn(echoPin, HIGH, timeOut); //read plus time of echoPin
    distance = (float)pingTime * 340.0 / 2.0 / 10000.0; // the sound speed is 340m/s, and
    calculate distance
    return distance;
}
```

Lastly, in the while loop of main function, get the measurement distance and display it continually.

```
while(1) {  
    distance = getSonar();  
    printf("The distance is : %.2f cm\n",distance);  
    delay(1000);  
}
```

About function **pulseIn()**:

**int pulseIn(int pin, int level, int timeout);**

Return the length of the pulse (in microseconds) or 0 if no pulse is completed before the timeout (unsigned long).

# Chapter 25 Attitude Sensor MPU6050

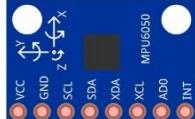

In this chapter, we will learn about a MPU6050 Attitude sensor, which integrates an Accelerometer and Gyroscope.

## Project 25.1 Read a MPU6050 Sensor Module

In this project, we will read Acceleration and Gyroscope Data of the MPU6050 Sensor.

### Component List

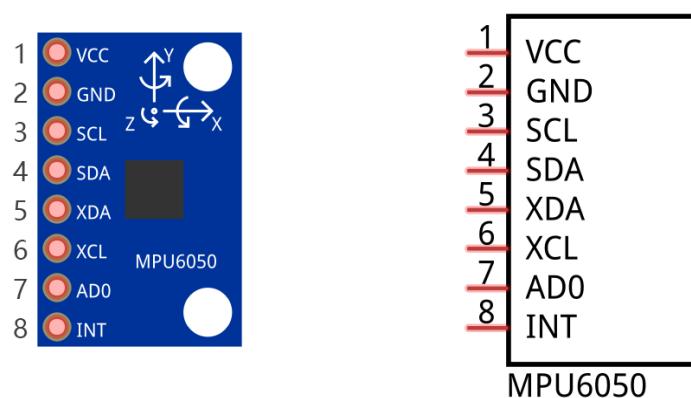

Raspberry Pi (with 40 GPIO) x1	MPU6050 x1
GPIO Expansion Board & Ribbon Cable x1	
Breadboard x1	
Jumper Wire x4	

## Component knowledge

### MPU6050

MPU6050 Sensor Module is a complete 6-axis Motion Tracking Device. It combines a 3-axis Gyroscope, a 3-axis Accelerometer and a DMP (Digital Motion Processor) all in a small package. The settings of the Accelerometer and Gyroscope of MPU6050 can be changed. A precision wide range digital temperature sensor is also integrated to compensate data readings for changes in temperature, and temperature values can also be read. The MPU6050 Module follows the I2C communication protocol and the default address is 0x68.

The port description of the MPU6050 Module is as follows:

Pin name	Pin number	Description
VCC	1	Positive pole of power supply with voltage 5V
GND	2	Negative pole of power supply
SCL	3	I2C communication clock pin
SDA	4	I2C communication data pin
XDA	5	I2C host data pin which can be connected to other devices.
XCL	6	I2C host clock pin which can be connected to other devices.
AD0	7	I2C address bit control pin. Low level: the device address is 0x68 High level: the device address is 0x69
INT	8	Output interrupt pin

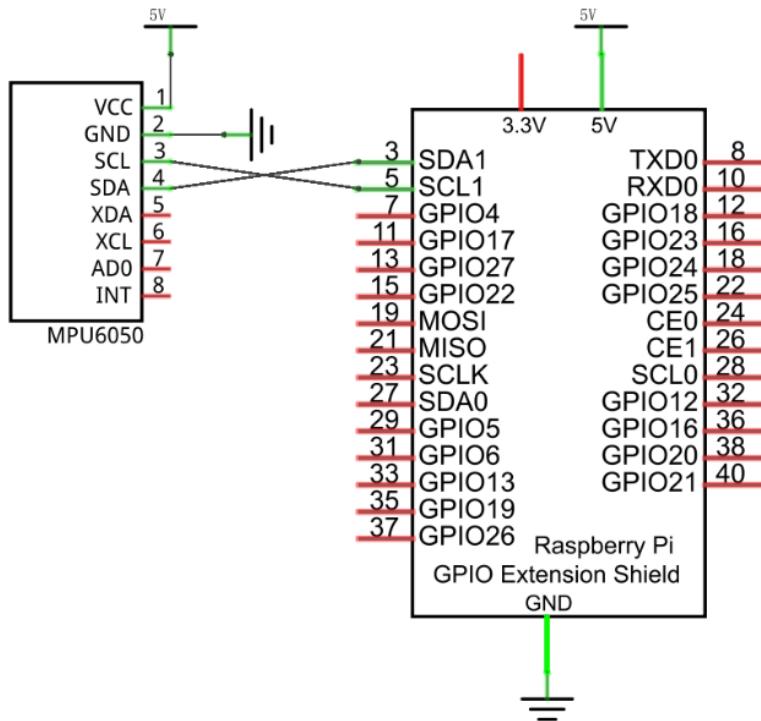

For more detail, please refer to the MPU6050 datasheet.

MPU6050 is widely used to assist with balancing vehicles, robots and aircraft, mobile phones and other products which require stability to control stability and attitude or which need to sense same.

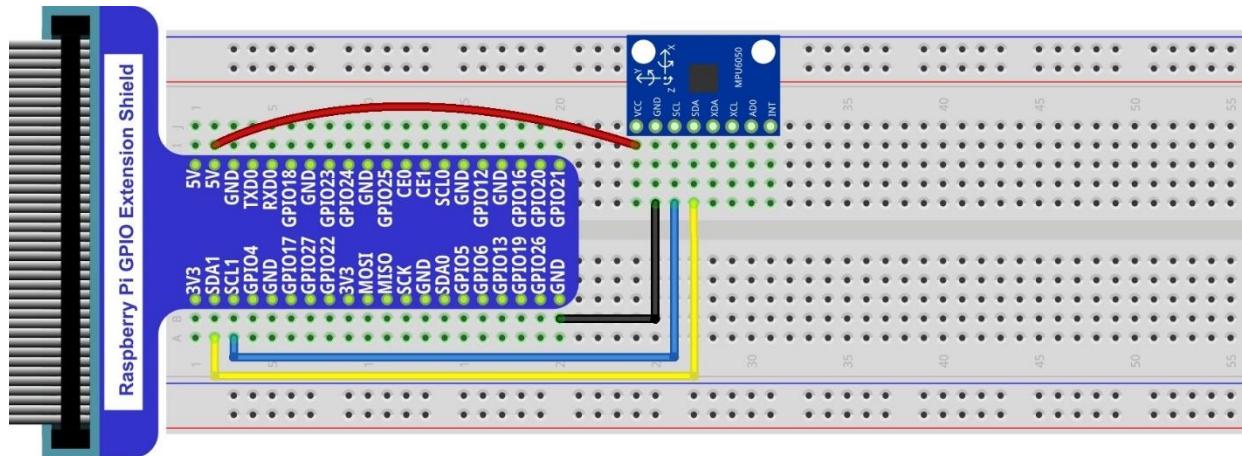

## Circuit

Note that the power supply voltage for MPU6050 module is 5V in this circuit.

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

In this project, we will read the acceleration data and gyroscope data of MPU6050, and print them out.

### C Code 25.1.1 MPU6050RAW

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: support@freenove.com

1. Use cd command to enter 25.1.1\_MPU6050RAW directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/25.1.1_MPU6050
```

2. Use following command to compile "MPU6050RAW.c", "MPU6050.cpp" and "I2Cdev.cpp", and generate executable file "MPU6050RAW".

```
gcc MPU6050RAW.cpp MPU6050.cpp I2Cdev.cpp -o MPU6050RAW
```

3. Then run the generated file "MPU6050RAW".

```
sudo ./MPU6050RAW
```

After the program is executed, the Terminal will display active accelerometer and gyroscope data of the MPU6050, as well as the conversion to gravity acceleration and angular velocity as units of data. As shown in the following figure:

```
a/g: 1360 120 15840 -320 -193 -114
a/g: 0.08 g 0.01 g 0.97 g -2.44 d/s -1.47 d/s -0.87 d/s
a/g: 1108 -88 15476 -354 -252 -115
a/g: 0.07 g -0.01 g 0.94 g -2.70 d/s -1.92 d/s -0.88 d/s
a/g: 1344 -264 15764 -396 -236 -121
a/g: 0.08 g -0.02 g 0.96 g -3.02 d/s -1.80 d/s -0.92 d/s
a/g: 1440 -180 15720 -375 -162 -114
a/g: 0.09 g -0.01 g 0.96 g -2.86 d/s -1.24 d/s -0.87 d/s
a/g: 1436 56 16608 -400 -154 -136
a/g: 0.09 g 0.00 g 1.01 g -3.05 d/s -1.18 d/s -1.04 d/s
a/g: 1008 144 14940 -345 -142 -129
a/g: 0.06 g 0.01 g 0.91 g -2.63 d/s -1.08 d/s -0.98 d/s
```

The following is the program code:

```
1 #include <stdio.h>
2 #include <stdint.h>
3 #include <unistd.h>
4 #include "I2Cdev.h"
5 #include "MPU6050.h"
6
7 MPU6050 accelgyro; //creat MPU6050 class object
8
9 int16_t ax, ay, az; //store acceleration data
10 int16_t gx, gy, gz; //store gyroscope data
11
12 void setup() {
13     // initialize device
14     printf("Initializing I2C devices... \n");
15     accelgyro.initialize(); //initialize MPU6050
```

```

16
17     // verify connection
18     printf("Testing device connections... \n");
19     printf(accelgyro.testConnection() ? "MPU6050 connection successful\n" : "MPU6050
connection failed\n");
20 }
21
22 void loop() {
23     // read accel/gyro values of MPU6050
24     accelgyro.getMotion6(&ax, &ay, &az, &gx, &gy, &gz);
25     // display accel/gyro x/y/z values
26     printf("a/g: %6hd %6hd %6hd %6hd %6hd\n", ax, ay, az, gx, gy, gz);
27     printf("a/g: %.2f g %.2f g %.2f g %.2f d/s %.2f d/s %.2f d/s
%.2f d/s\n", (float)ax/16384, (float)ay/16384, (float)az/16384,
28             (float)gx/131, (float)gy/131, (float)gz/131);
29 }
30
31
32 int main()
33 {
34     setup();
35     while(1){
36         loop();
37     }
38     return 0;
39 }
```

Two library files "**MPU6050.h**" and "**I2Cdev.h**" are used in the code and will be compiled with others. Class **MPU6050** is used to operate the MPU6050 Sensor. When used, first it initiates an object.

	MPU6050 accelgyro;
--	--------------------

In the setup function, the MPU6050 is initialized and the result of the initialization will be tested.

	<pre> void setup() {     // initialize device     printf("Initializing I2C devices... \n");     accelgyro.initialize();      //initialize MPU6050      // verify connection     printf("Testing device connections... \n");     printf(accelgyro.testConnection() ? "MPU6050 connection successful\n" : "MPU6050 connection failed\n"); }</pre>
--	---

In the loop function, read the original data of MPU6050, display them and then convert the original data into the corresponding acceleration and angular velocity values, then display the converted data out.

	<pre> void loop() {     // read raw accel/gyro measurements from device     accelgyro.getMotion6(&amp;ax, &amp;ay, &amp;az, &amp;gx, &amp;gy, &amp;gz);</pre>
--	---

```
// display accel/gyro x/y/z values
printf("a/g: %6hd %6hd %6hd %6hd %6hd\n", ax, ay, az, gx, gy, gz);
printf("a/g: %.2f g %.2f g %.2f g %.2f d/s %.2f d/s
\n", (float)ax/16384, (float)ay/16384, (float)az/16384,
      (float)gx/131, (float)gy/131, (float)gz/131);
}
```

Finally, the main functions, called setup function and loop function respectively.

```
int main()
{
    setup();
    while(1){
        loop();
    }
    return 0;
}
```

About class MPU6050:

### Class MPU6050

This is a class library used to operate the MPU6050, which can directly read and set the MPU6050. Here are its functions:

**MPU6050() /MPU6050(uint8\_t address):**

Constructor. The parameter is I2C address, and the default I2C address is 0x68.

**void initialize();**

Initialization function, used to wake up MPU6050. Range of accelerometer is  $\pm 2g$  and range of gyroscope is  $\pm 250$  degrees/sec.

**void getMotion6(int16\_t\* ax, int16\_t\* ay, int16\_t\* az, int16\_t\* gx, int16\_t\* gy, int16\_t\* gz);**

Get the original data of accelerometer and gyroscope.

**int16\_t getTemperature();**

Get the original temperature data of MPU6050.

For details about more relevant member functions, please refer to MPU6050.h or visit:

<https://github.com/jrowberg/i2cdevlib>

# Chapter 26 High-sensitivity microphone sensor

In this chapter, we will learn how to use High-sensitivity microphone sensor.

## Project 26.1 High-sensitivity microphone sensor and LED

This project will use a high-sensitivity microphone sensor to make a sound-controlled light.

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x6 	
High-sensitivity microphone sensor x1 	LED x1 	Resistor 220Ω x1 

### Component knowledge

#### High-sensitivity microphone sensor

The high-sensitivity microphone sensor module is a component that accepts sound waves and converts them into electrical signals, which can detect the sound intensity in the surrounding environment.

When using it, it should be noted that this sensor can only identify the presence or absence of sound (according to the vibration principle), but cannot identify the size of the sound or the sound of a specific frequency.

This module has 4 pins: digital output (DO), analog output (AO), power supply positive pin and power supply negative pin. AO can output the voltage signal of the microphone in real time. When the ambient sound intensity does not reach the set threshold, the DO outputs a low-level signal, and when the ambient sound intensity exceeds the set threshold, it outputs a high-level signal, and the sensitivity can be adjusted by a potentiometer. When in use, adjust the potentiometer to make the sensitivity to sound reach a more appropriate value, and then read the digital output signal of the module through a pin on the development board. You can speak to the sensor. When the sensor detects a speaking sound, the DO pin outputs a high level; when the sensor does not detect a speaking sound, the DO pin outputs a low level.

Below is the pinout of the high-sensitivity microphone sensor.

#### Pin description:

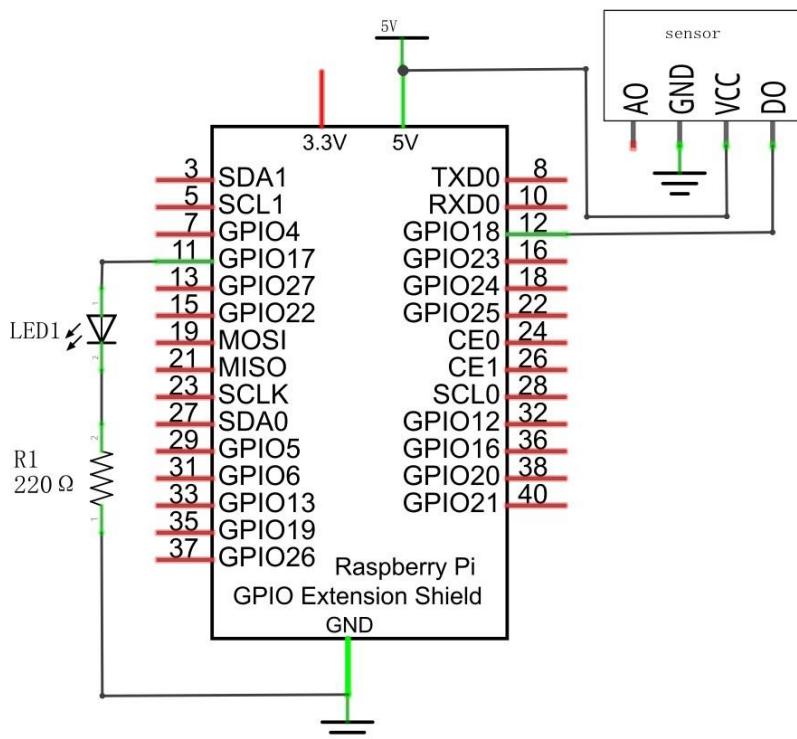

symbol	Function
DO	Digital signal output
VCC	Power supply pin, +3.3V~5.0V
GND	GND
AO	Analog signal output

Since the default sensitivity of the high-sensitivity microphone sensor is high, the two LED lights on the module are lit up after power-on, and the sensitivity should be adjusted to an appropriate value at this time. When the potentiometer is adjusted clockwise, the module identification sensitivity increases; When counterclockwise adjustment potentiometer, module recognition sensitivity decreases. Please adjust the potentiometer before using the module to make its sensitivity reach the appropriate value. Under normal circumstances, you need counterclockwise rotation of the potentiometer, so that the output of the module LED off, when the sensitivity is low can be appropriate clockwise adjustment of the potentiometer, please ensure that your sensor output LED is extinguished when energized, in order to identify the sound.

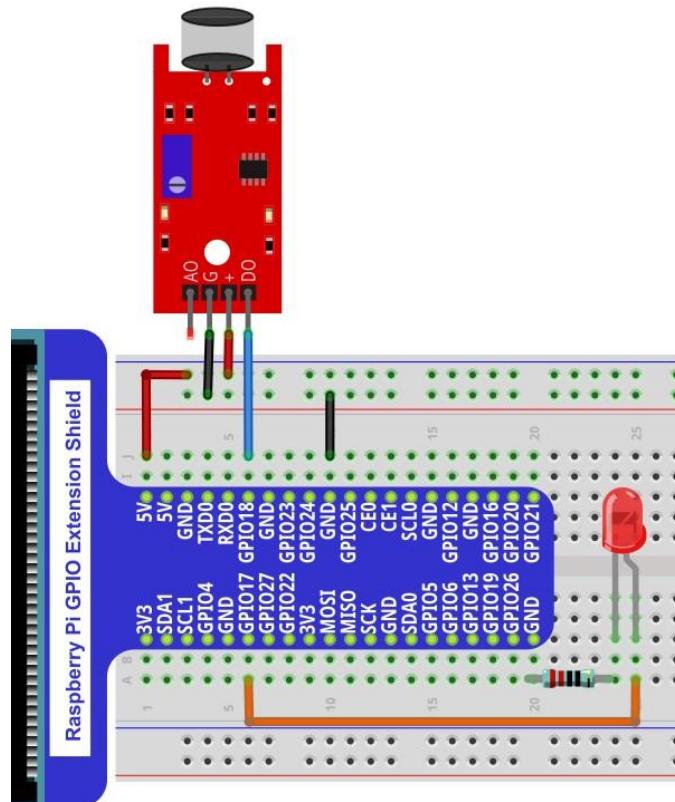

Please do not use voltage beyond the power supply range to avoid damage to the high-sensitivity microphone sensor.

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

### C Code 26.1.1 VoiceLamp

First observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter 26.1.1\_VoiceLamp directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/26.1.1_VoiceLamp
```

2. Use following command to compile " VoiceLamp.c" and generate executable file " VoiceLamp ".

```
gcc VoiceLamp.c -o VoiceLamp -lwiringPi
```

3. Run the generated file "VoiceLamp"

```
sudo ./VoiceLamp
```

After the program is executed, when you speak to the sensor, the LED will turn on for 5 seconds. After 5 seconds, the LED will turn off. When the sensor does not recognize the sound, the LED will turn off.

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <stdlib.h>
4 #define ledPin 0 //define the ledPin
5 #define sensorPin 1 //define the sensorPin

```

```
6
7 void main(void)
8 {
9     printf("Program is starting ... \n");
10    wiringPiSetup();           //Initialize wiringPi.
11    pinMode(ledPin, OUTPUT); //Set ledPin to output
12    pinMode(sensorPin, INPUT); //Set sensorPin to input
13    while(1) {
14        if(digitalRead(sensorPin) == HIGH) { //The sensor is blocked
15            digitalWrite(ledPin, HIGH);      //Make GPIO output HIGH level
16            delay(5000);
17            digitalWrite(ledPin, LOW);
18            printf("led turned on >>>\n"); //Output information on terminal
19        }
20        else {                      // The sensor is not blocked
21            digitalWrite(ledPin, LOW); //Make GPIO output LOW level
22            printf("led turned off <<<\n"); //Output information on terminal
23        }
24    }
25 }
```

Read the signal pin of the high-sensitivity microphone sensor, and determine whether the state of the sensor is high level. If it is high level, the LED will continue to turn on for 5 seconds.

```
if(digitalRead(sensorPin) == LOW) { //The sensor is blocked
    digitalWrite(ledPin, HIGH);      //Make GPIO output HIGH level
    delay(5000);
    digitalWrite(ledPin, LOW);
    printf("led turned on >>>\n"); //Output information on terminal
}
else {                      //The sensor is not blocked
    digitalWrite(ledPin, LOW); //Make GPIO output LOW level
    printf("led turned off <<<\n"); //Output information on terminal
```

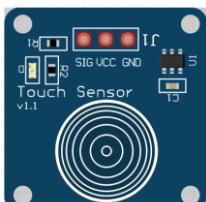

# Chapter 27 Touch Sensor TTP223

In this chapter, we will learn how to use the touch sensor.

## Project 27.1 Touch Sensor and LED

This project will use the touch sensor to control the LED to emit different brightness.

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x7 	
TTP223 Touch Sensor x1 	LED x1 	Resistor 220Ω x1 

### Component knowledge

#### Touch Sensor

The touch sensor module is a capacitive touch switch module based on TTP223 chip. Its use is very simple. This module has 3 pins: signal pin, power positive pin and power negative pin. When the positive and negative pins of the module are connected to a suitable power supply, the module starts to work. At this time, only one pin on the development board is needed to read the output signal of the module. For example, you can touch the front and back of the module. When the touch sensor is touched, the signal pin outputs a high level; when the touch sensor is not touched, it outputs a low level.

Below is the pinout of the touch sensor.

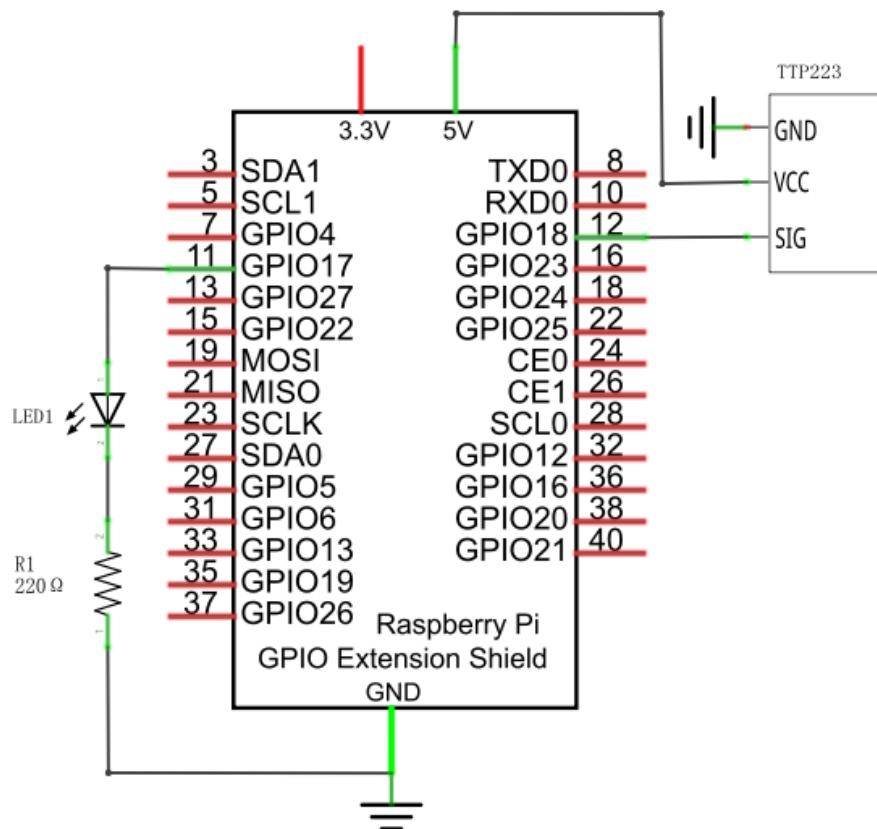

#### Pin description:

symbol	Function
SIG	Output control signal
VCC	Power supply pin, +2.0V~5.5V
GND	GND

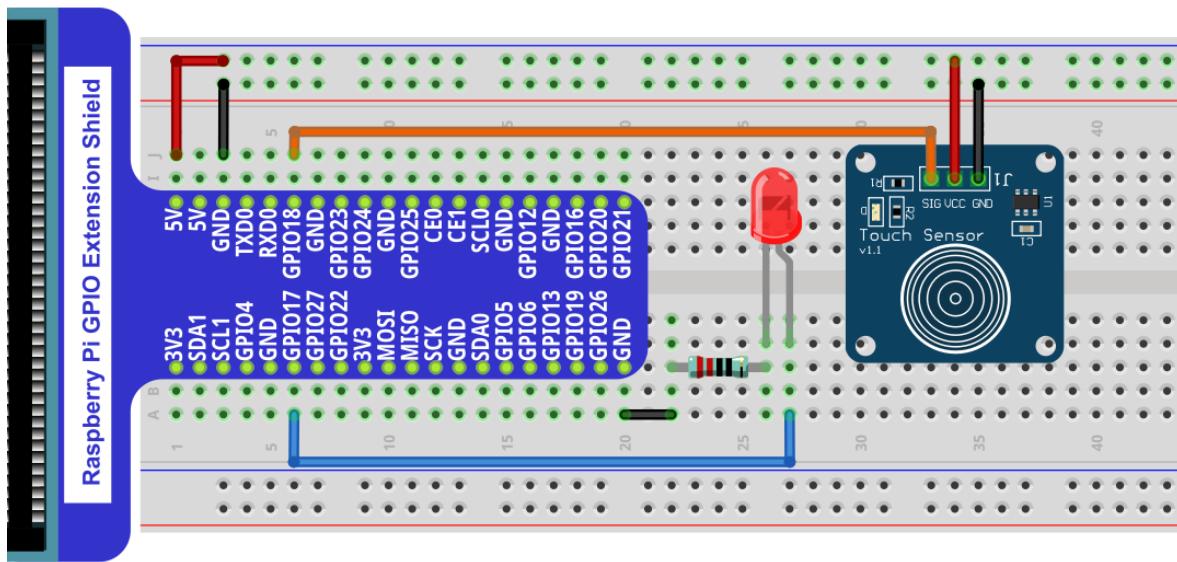

Please do not use voltage beyond the power supply range to avoid damage to the touch sensor.

## Circuit

Schematic diagram

Hardware connection. If you need any support, please free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

### C Code 27.1.1 TouchSensor

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter 27.1.1\_TouchSensor directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/27.1.1_TouchSensor
```

2. Use following command to compile " TouchSensor.c " and generate executable file " TouchSensor ".

```
gcc TouchSensor.c -o TouchSensor -lwiringPi
```

3. Run the generated file "TouchSensor".

```
sudo ./TouchSensor
```

In this code, we use the touch sensor to adjust the brightness of the LED. Every time you touch the sensor with your hand, the brightness of the LED changes.

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <softPwm.h>
4 #define ledPin 0      //define the ledPin
5 #define SensorPin 1    //define the SensorPin
6
7 int SensorState=LOW;    //store the State of button
8 int lastSensorState=LOW;//store the lastState of Sensor
9 long lastChangeTime;    //store the change time of Sensor state
10 long captureTime=10;   //set the stable time for Sensor state
11 int Sensorvalue;
12 int grade=0;
13
14 int main(void)
15 {
16     printf("Program is starting...\n");
17     wiringPiSetup();           //Initialize wiringPi.
18     softPwmCreate(ledPin, 0, 100); //Creat SoftPWM pin
19     pinMode(SensorPin, INPUT); //Set SensorPin to input
20     pullUpDnControl(SensorPin, PUD_DOWN); //pull up to high level
21     while(1) {
22         Sensorvalue = digitalRead(SensorPin); //read the current state of Sensor
23         if( Sensorvalue != lastSensorState){ //if the Sensor state has changed, record the
time point
24             lastChangeTime = millis();
25         }
26         //if changing-state of the Sensor last beyond the time we set, we consider that

```

```

27 //the current Sensor state is an effective change rather than a buffeting
28 if(millis() - lastChangeTime > captureTime){
29     //if sensor state is changed, update the data.
30     if(Sensorvalue != SensorState){
31         SensorState = Sensorvalue;
32         //if the state is low, it means the action is pressing
33         if(SensorState == HIGH){
34             grade=grade+1;
35             printf("Sensor is pressed!\n");
36         }
37     }
38 }
39 else if(grade==1){
40     softPwmWrite(ledPin, 35);
41 }
42 else if(grade==2){
43     softPwmWrite(ledPin, 65);
44 }
45 else if(grade==3){
46     softPwmWrite(ledPin, 100);
47 }
48 else if(grade==4){
49     grade=0;
50 }
51 else {
52     softPwmWrite(ledPin, 0);
53 }
54 lastSensorState = Sensorvalue;
55 }
56 return 0;
57 }
```

Read the signal pin of the touch sensor, and determine whether the state of the touch sensor has changed. If it has changed, record the time point.

```

Sensorvalue = digitalRead(SensorPin); //read the current state of Sensor
if( Sensorvalue != lastSensorState){ //if the Sensor state has changed, record the
    time point
    lastChangeTime = millis();
}
```

Check whether the state of the touch sensor is consistent with the previous moment every captureTime milliseconds. If not, assign the state of the touch sensor to the touch sensor variable SensorState.

```

if(millis() - lastChangeTime > captureTime){
    //if sensor state is changed, update the data.
```

```
if(Sensorvalue != SensorState) {  
    SensorState = Sensorvalue;
```

Each time the sensor is touched, a variable grade is used to record the number of touches.

```
if(Sensorvalue != SensorState) {  
    SensorState = Sensorvalue;  
    if (SensorState == HIGH) {  
        grade=grade+1;  
        printf("Sensor is pressed!\n");  
    }  
}
```

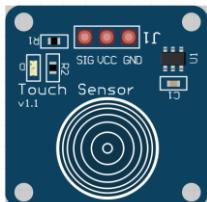

Set the LED light to emit different brightness according to the value of grade.

```
if(grade==1) {  
    softPwmWrite(LEDPin, 35);  
}  
else if(grade==2) {  
    softPwmWrite(LEDPin, 65);  
}  
else if(grade==3) {  
    softPwmWrite(LEDPin, 100);  
}  
else if(grade==4) {  
    grade=0;  
}  
else {  
    softPwmWrite(LEDPin, 0);  
}
```

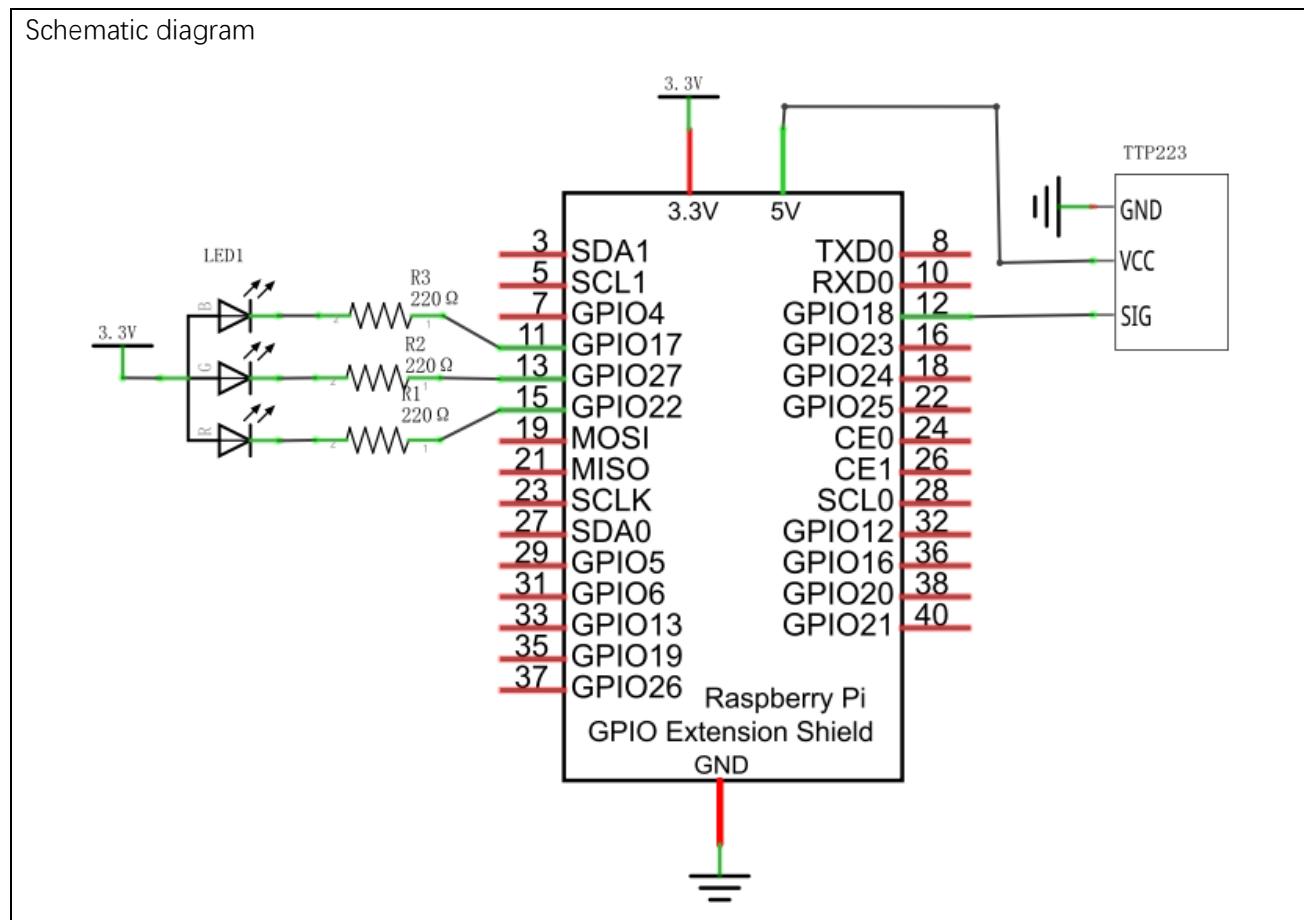

## Project 27.2 Touch Sensor and RGB LED

This project uses a touch sensor to control RGB LED to emit different colors.

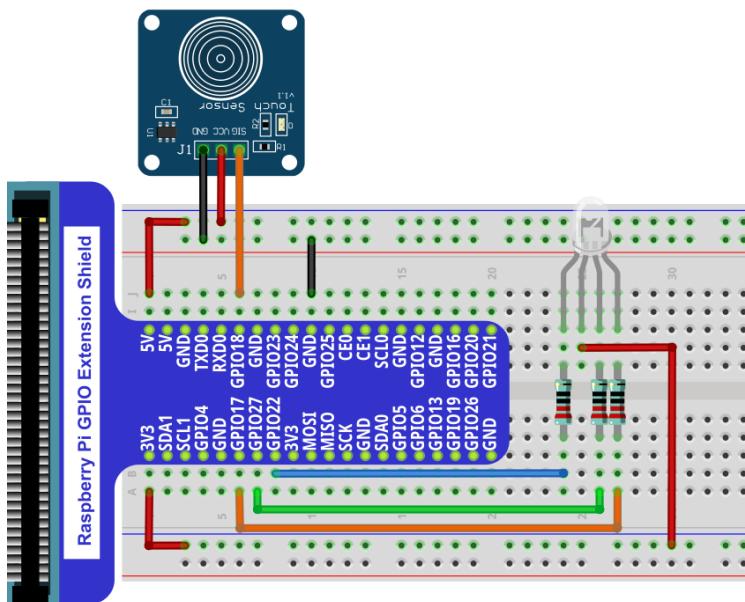

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x10
TTP223 Touch Sensor x1	RGB LED x1
	

### Circuit

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

### C Code 27.2.1 Discolor

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter 27.2.1\_Discolor directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/27.2.1_Discolor
```

2. Use following command to compile " Discolor.c " and generate executable file " Discolor ".

```
gcc Discolor.c -o Discolor -lwiringPi
```

3. Run the generated file "Discolor".

```
sudo ./Discolor
```

After the program is executed, we can use the touch sensor to adjust the color change of the RGB LED. Every time the sensor is touched, the color of the RGB LED changes. Color changes from red to green to blue.

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <softPwm.h>
4 #include <stdlib.h>
5 #define SensorPin 1 //define the SensorPin
6 #define ledPinRed 3
7 #define ledPinGreen 2
8 #define ledPinBlue 0
9

```

```
10 int SensorState=LOW; //store the State of Sensor
11 int lastSensorState=LOW;//store the lastState of Sensor
12 long lastChangeTime; //store the change time of Sensor state
13 long captureTime=10; //set the stable time for Sensor state
14 int Sensorvalue;
15 int grade=0;
16
17 void setupLedPin(void)
18 {
19     softPwmCreate(ledPinRed, 0, 100); //Creat SoftPWM pin for red
20     softPwmCreate(ledPinGreen,0, 100); //Creat SoftPWM pin for green
21     softPwmCreate(ledPinBlue, 0, 100); //Creat SoftPWM pin for blue
22 }
23 void setLedColor(int r, int g, int b)
24 {
25     softPwmWrite(ledPinRed, r); //Set the duty cycle
26     softPwmWrite(ledPinGreen, g); //Set the duty cycle
27     softPwmWrite(ledPinBlue, b); //Set the duty cycle
28 }
29 int main(void)
30 {
31     int r,g,b;
32     printf("Program is starting... \n");
33     wiringPiSetup(); //Initialize wiringPi.
34     pinMode(SensorPin, INPUT); //Set SensorPin to input
35     pullUpDnControl(SensorPin, PUD_DOWN); //pull up to high level
36     setupLedPin();
37     r=100;
38     g=100;
39     b=100;
40     setLedColor(r, g, b); // set the duty cycle value
41     while(1) {
42         Sensorvalue = digitalRead(SensorPin); //read the current state of Sensor
43         if( Sensorvalue != lastSensorState){ //if the Sensor state has changed, record the
time point
44             lastChangeTime = millis();
45         }
46         //if changing-state of the Sensor last beyond the time we set, we consider that
47         //the current Sensor state is an effective change rather than a buffeting
48         if(millis() - lastChangeTime > captureTime){
49             //if Sensor state is changed, update the data.
50             if(Sensorvalue != SensorState){
51                 SensorState = Sensorvalue;
52                 //if the state is low, it means the action is pressing
```

```
53             if (SensorState == HIGH) {  
54                 printf("Sensor is pressed!\n");  
55                 grade=grade+1;  
56             }  
57         }  
58     }  
59     if(grade==1) {  
60         r=0;  
61         g=100;  
62         b=100;  
63         setLedColor(r,g,b); //set the duty cycle value  
64         printf("r=%d, g=%d, b=%d \nThe current color is red\n",r,g,b);  
65     }  
66     else if(grade==2) {  
67         r=100;  
68         g=0;  
69         b=100;  
70         setLedColor(r,g,b); //set the duty cycle value  
71         printf("r=%d, g=%d, b=%d \nThe current color is green\n",r,g,b);  
72     }  
73     else if(grade==3) {  
74         r=100;  
75         g=100;  
76         b=0;  
77         setLedColor(r,g,b); //set the duty cycle value  
78         printf("r=%d, g=%d, b=%d \nThe current color is blue\n",r,g,b);  
79     }  
80     else if(grade==4) {  
81         grade=0;  
82     }  
83     else {  
84         r=100;  
85         g=100;  
86         b=100;  
87         setLedColor(r,g,b); //set the duty cycle value  
88     }  
89     lastSensorState = Sensorvalue;  
90 }  
91 return 0;  
92 }
```

Define a function called setupLedPin() to initialize the PWM configuration of the R, G, and B pins.

```
void setupLedPin(void)  
{
```

```
softPwmCreate(ledPinRed, 0, 100); //Creat SoftPWM pin for red  
softPwmCreate(ledPinGreen,0, 100); //Creat SoftPWM pin for green  
softPwmCreate(ledPinBlue, 0, 100); //Creat SoftPWM pin for blue  
}
```

Determine the number of times the sensor is pressed, and control the pin R, G, and B to output different PWM values, thereby controlling the color of the RGB LED.

```
if(grade==1){  
    r=0;  
    g=100;  
    b=100;  
    setLedColor(r,g,b); //set the duty cycle value  
    printf("r=%d, g=%d, b=%d \nThe current color is red\n",r,g,b);  
}
```

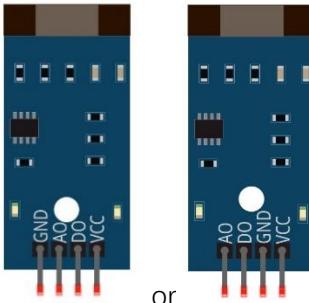

# Chapter 28 U-shaped photoelectric sensor

In this chapter, we will learn how to use a U-shaped photoelectric sensor.

## Project 28.1 U-shaped photoelectric sensor and LED

This project uses a U-shaped photoelectric sensor to control the state of the LED.

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x6 	
U-shaped photoelectric sensor x1 	LED x1 	Resistor 220Ω x1 

### Component knowledge

#### U-shaped photoelectric sensor

The U-shaped photoelectric sensor is a through-beam photoelectric sensor, which consists of a transmitting end and a receiving end. Its working principle is blocking and conducting the infrared emission light will change the current induced by the infrared receiving tube.

This module has 4 pins: digital output (DO), analog output (AO), power supply positive pin and power supply negative pin. When the positive and negative pins of the module are connected to a suitable power supply, the module starts to work. Only one pin on the development board is needed to read the digital output (DO) signal of the module. When the photoelectric sensor is blocked, the digital signal pin outputs a low level. If the photoelectric sensor is not blocked, it outputs a high level.

Below is the pinout of the touch sensor.

Pin description:

symbol	Function
VCC	Power supply pin, +3.3V~5.5V
DO	Output control signal(High or low level)
AO	Output invalid

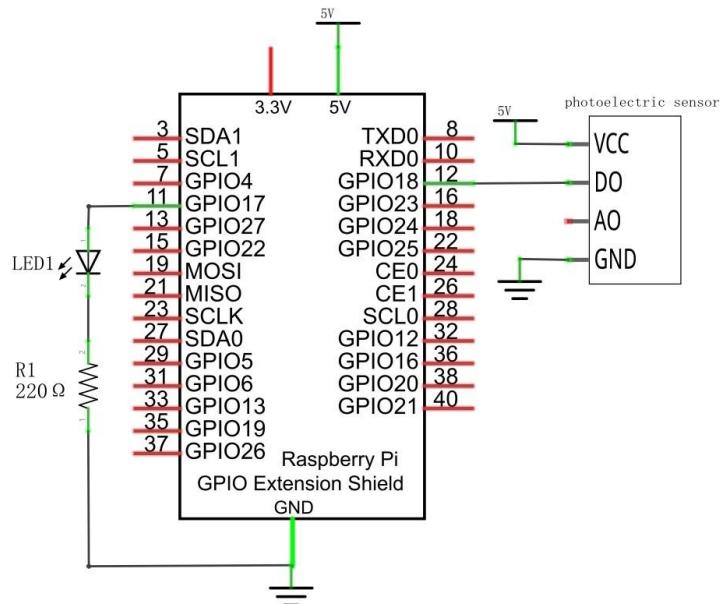

GND	GND
-----	-----

Please do not use the voltage beyond the power supply range to avoid damage to the U-shaped photoelectric sensor.

The difference between the above two U-type photoelectric sensors is that in addition to the different pin sequence, the output signal is opposite when you block it, that is, there are modules that output high level and low level U-type photoelectric sensor. The specific module is subject to the one in your hand. Please check the pin sequence of your U-shaped photoelectric sensor and replace the appropriate wiring to avoid permanent damage to your raspberry PI.

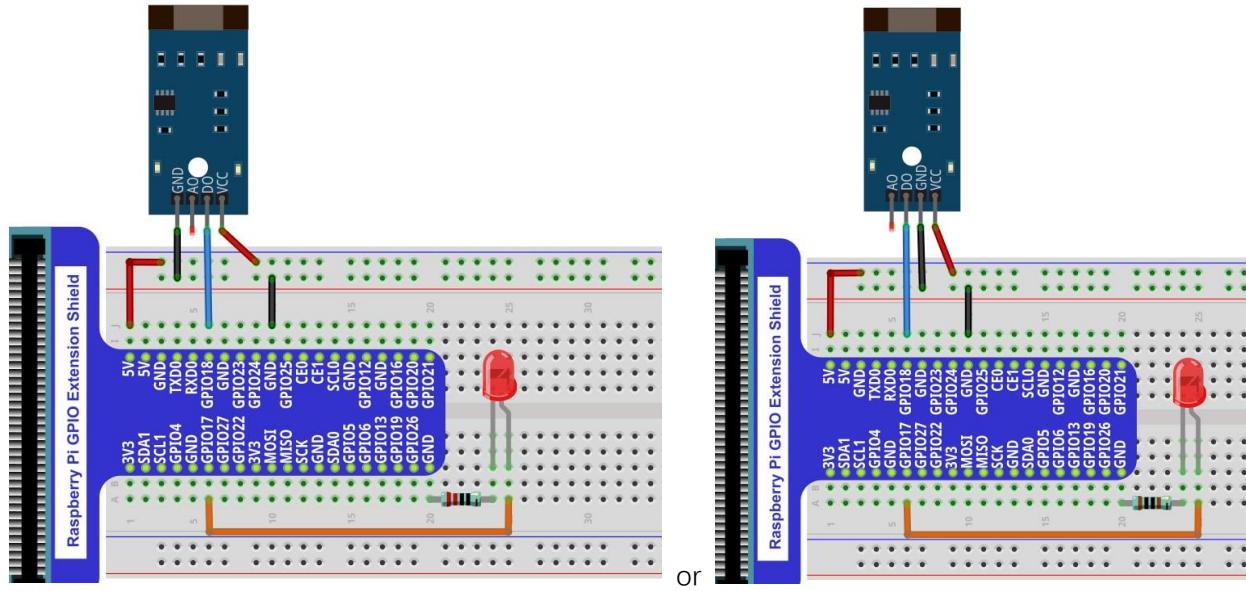

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

Please check the sequence of your U-shaped photoelectric sensor and select the appropriate wiring to avoid permanent damage to your raspberry PI.

## Code

### C Code 28.1.1 PhotoSensor

First observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: support@freenove.com

1. Use cd command to enter 28.1.1\_PhotoSensor directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/28.1.1_PhotoSensor
```

2. Use following command to compile " PhotoSensor.c" and generate executable file "PhotoSensor".

```
gcc PhotoSensor.c -o PhotoSensor -lwiringPi
```

3. Run the generated file " PhotoSensor"

```
sudo ./PhotoSensor
```

When you use the module whose output signal is low level, after the program is executed, when the photoelectric sensor is blocked, the LED lights up, when the photoelectric sensor is not blocked, the LED turns off.

When you use the module with high output signal, the LED will be off when the photoelectric sensor is blocked and on when the photoelectric sensor is not blocked after the program is executed.

The phenomena are opposite, depending on the module in your hand.

The following is the program code:

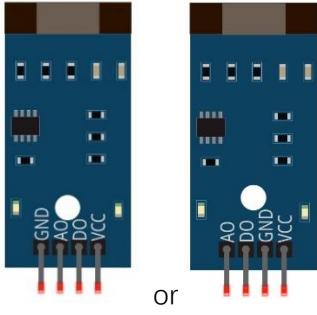

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #define ledPin      0      //define the ledPin
4 #define sensorPin   1      //define the sensorPin
5
6 void  main(void)
7 {
8     printf("Program is starting ... \n");
9     wiringPiSetup(); //Initialize wiringPi.
10    pinMode(ledPin, OUTPUT); //Set ledPin to output
11    pinMode(sensorPin, INPUT); //Set sensorPin to input
12    while(1) {
13        if(digitalRead(sensorPin) == LOW){ // The sensor is blocked
14            digitalWrite(ledPin, HIGH); //Make GPIO output HIGH level
15            printf("The sensor is blocked, led turned on >>>\n"); //Output information on
16            terminal
17        }
18        else { // The sensor is not blocked
19            digitalWrite(ledPin, LOW); //Make GPIO output LOW level
20            printf("The sensor is not blocked, led turned off <<<\n"); //Output information on
21            terminal
22        }
23    }
24 }
```

## Project 28.2 U-shaped photoelectric sensor and buzzer

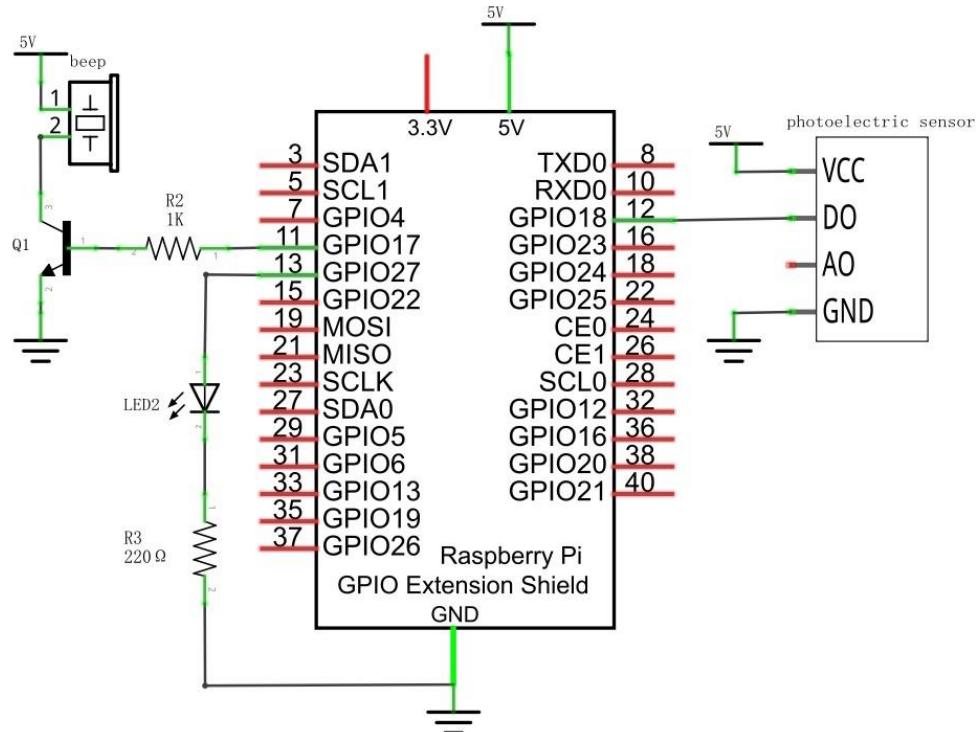

This project uses U-shaped photoelectric sensor to make a simple sound and light alarm.

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x10 	
Active buzzer x1 	NPN transistor x1 (S8050) 	Resistor 1kΩx1 
U-shaped photoelectric sensor x1 	LED x1 	Resistor 220Ωx1 

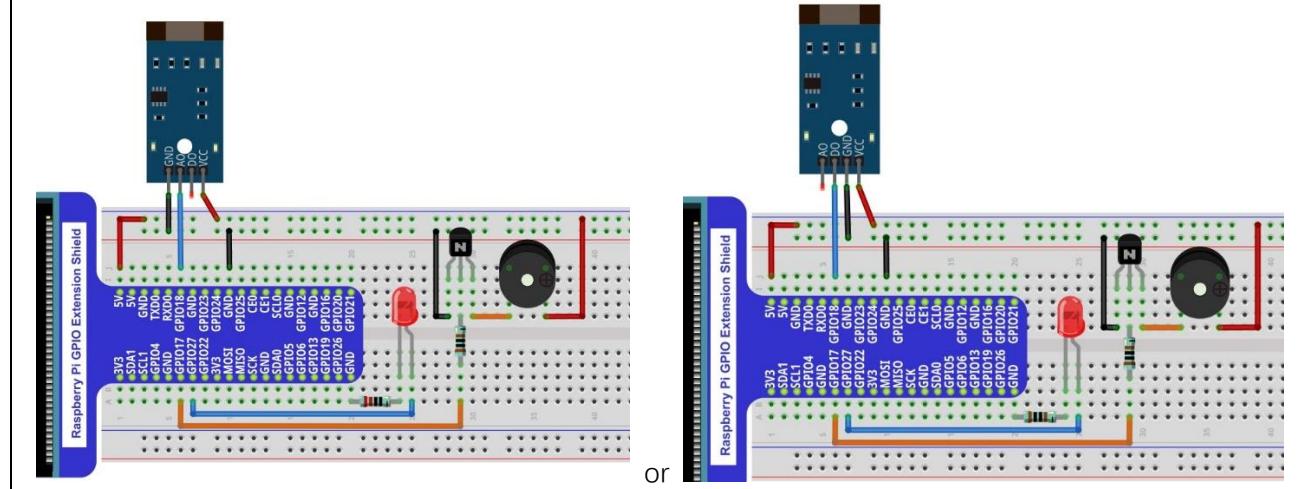

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

Please check the sequence of your U-shaped photoelectric sensor and select the appropriate wiring to avoid permanent damage to your raspberry PI.

## Code

### C Code 28.2.1 Alertor

First observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter 28.2.1\_Alertor directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/28.2.1_Alertor
```

2. Use following command to compile " Alertor.c" and generate executable file "Alertor".

```
gcc Alertor.c -o Alertor -lwiringPi
```

3. Run the generated file " Alertor"

```
sudo ./Alertor
```

After the program is executed, every time the U-shaped photoelectric sensor is blocked by hand, the buzzer will sound an alarm, and the LED will flash to remind.

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <stdlib.h>
4 #define ledPin      0 //define the ledPin
5 #define sensorPin   1 //define the buttonPin
6 #define buzzerPin   2 //define the buzzerPin
7
8 void alarm(int times){
9     while(times--) {
10         digitalWrite(buzzerPin, HIGH);
11         digitalWrite(ledPin, HIGH);
12         delay(50);
13         digitalWrite(buzzerPin, LOW);
14         digitalWrite(ledPin, LOW);
15         delay(50);
16     }
17 }
18
19 void sensorEven(void) {
20     alarm(3);
21 }
22 void main(void)
23 {
24     printf("Program is starting ... \n");
25     wiringPiSetup();           //Initialize wiringPi.
26     pinMode(ledPin, OUTPUT);  //Set ledPin to output
27     pinMode(sensorPin, INPUT); //Set sensorPin to input
28     pinMode(buzzerPin, OUTPUT);
```

```
29     delay(100);
30     wiringPiISR(sensorPin, INT_EDGE_BOTH, &sensorEven);
31     digitalWrite(buzzerPin, LOW);
32     while(1) {
33     }
34 }
```

The `wiringPiISR()` function associates the sensor pins with `sensorEven()`. Because there are high level triggering module and low level triggering module in the U-type photoelectric sensor, we use the double-edge detection method here to make the program compatible with the module in your hand. When `sensorPin` detects low level or high level, it will call and execute the `sensorEven()` function.

```
wiringPiISR(sensorPin, INT_EDGE_BOTH, &sensorEven);
void sensorEven(void) {
    alarm(3);
}
```

The function `alarm()` is used to control the active buzzer to emit an alarm sound and control the LED to flash at the same time. Use variable `times` to pass in the number of times the alarm sounds and the LED blinks.

```
void alarm(int times) {
    while(times--) {
        digitalWrite(buzzerPin, HIGH);
        digitalWrite(ledPin, HIGH);
        delay(50);
        digitalWrite(buzzerPin, LOW);
        digitalWrite(ledPin, LOW);
        delay(50);
    }
}
```

### int `wiringPiISR (int pin, int edgeType, void (*function)(void))`;

This is an interrupt detection function. The first parameter specifies the IO port to detect. The second parameter specifies the trigger method to detect. The third parameter specifies the function name. The function will be executed when the specified action is detected.

The following are common detection triggers:

**INT\_EDGE\_FALLING**: falling edge trigger

**INT\_EDGE\_RISING**: rising edge trigger

**INT\_EDGE\_BOTH**: triggers both up and down

# Chapter 29 Hall sensor

In this chapter, we will learn how to use Hall sensor.

## Project 29.1 Hall sensor and LED

This project uses hall sensor to control the state of LED.

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x6		
Hall sensor x1	LED x1	Resistor 220Ω x1	Speaker x1

The table lists the components required for the project. It includes a Raspberry Pi (40 GPIO), a GPIO Expansion Board, a ribbon cable, a breadboard, a Hall sensor, a jumper wire, an LED, a resistor (220Ω), and a speaker. The Hall sensor is shown in two configurations: one with pins labeled GND, AO, DO, VCC, and another with pins labeled AO, DO, GND, VCC. A green horizontal line represents the jumper wire.

### Component knowledge

#### Hall sensor

Hall sensor is a magnetic field sensor made according to the Hall effect. Based on the Hall effect, Hall voltage varies with magnetic field strength. Hall sensors can be divided into linear (analog) Hall sensors and switching Hall sensors. Linear Hall sensors have two outputs: analog output (AO), digital output (DO). Switching Hall sensors only have digital output (DO) and the analog output (AO) output has no effect. In this project, the switch Hall sensor is used. Its use is very simple.

This module has 4 pins: digital output (DO), analog output (AO), power supply positive pin and power supply negative pin. When the positive and negative pins of the module are connected to a suitable power supply, the module starts to work. Only one pin on the development board is needed to read the digital output (DO) signal of the module. In the project, the speaker is used as the magnetic field source, when you put the sensor close to the magnetic field (speaker), the DO outputs low level, and if the sensor does not sense the magnetic field (speaker), the DO outputs high level.

Below is the pinout of the Hall sensor.

Pin description:

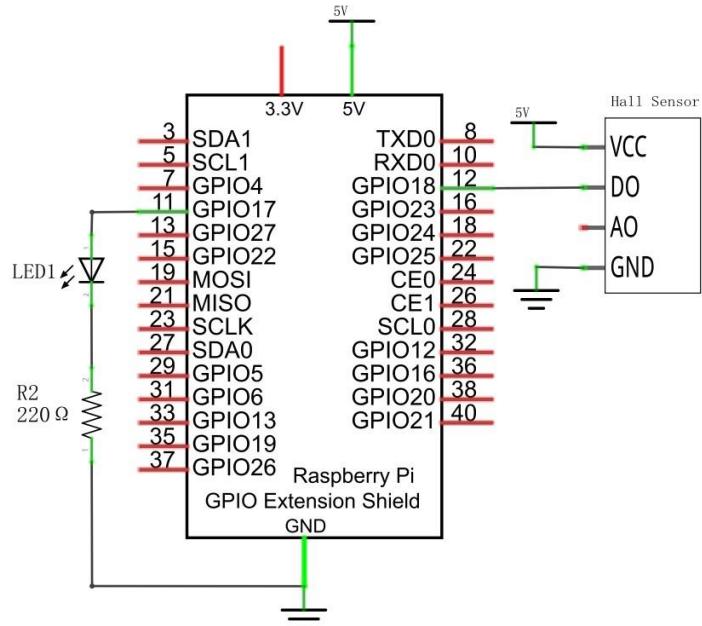

symbol	Function
VCC	Power supply pin, +3.3V~5.5V
DO	Output control signal
AO	Output invalid
GND	GND

Please do not use voltage beyond the power supply range to avoid damage to the Hall sensor.

For the above two hall sensors, their difference is only the pin sequence is different, please get the Hall sensor, check its sequence, change the corresponding wiring, so as not to cause permanent damage to your raspberry PI.

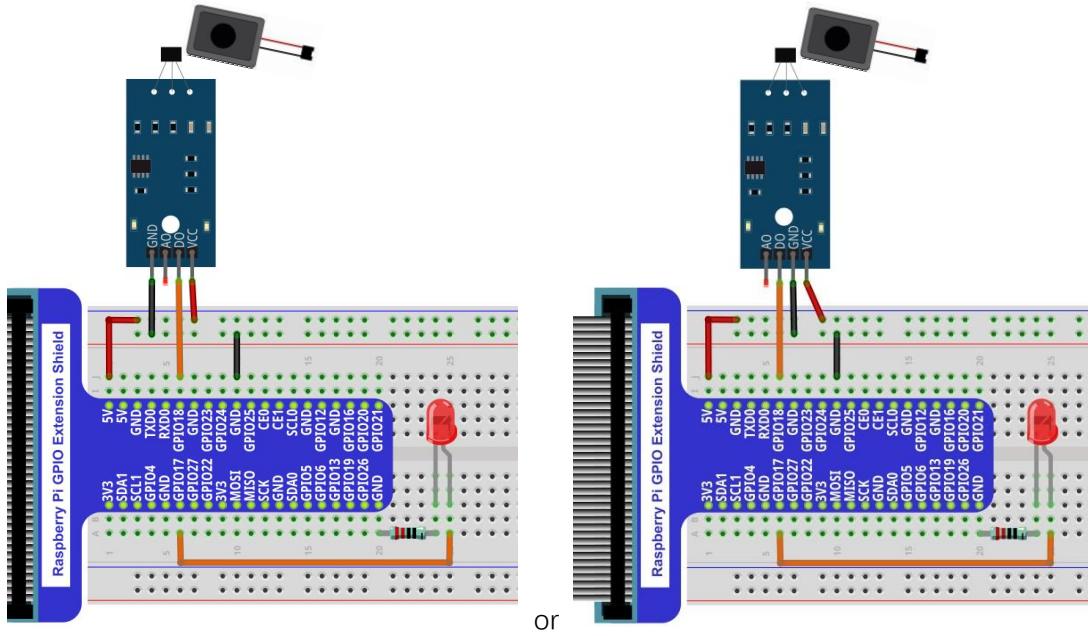

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

Please check the sequence of your Hall sensor and select the appropriate wiring to avoid permanent damage to your raspberry PI.

## Code

### C Code 29.1.1 HallSensor

First observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: support@freenove.com

1. Use cd command to enter 29.1.1\_HallSensor directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/29.1.1_HallSensor
```

2. Use following command to compile " HallSensor.c" and generate executable file "HallSensor".

```
gcc HallSensor.c -o HallSensor -lwiringPi
```

3. Run the generated file "HallSensor"

```
sudo ./HallSensor
```

After the program is executed, when the sensor is close to the magnetic field (horn) by hand, the LED will turn on, and if the sensor does not sense the magnetic field (horn), the LED will turn off.

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #define ledPin      0      //define the ledPin
4 #define sensorPin   1      //define the sensorPin
5
6 void  main(void)
7 {
8     printf("Program is starting ... \n");
9     wiringPiSetup(); //Initialize wiringPi.
10    pinMode(ledPin, OUTPUT); //Set ledPin to output
11    pinMode(sensorPin, INPUT); //Set sensorPin to input
12    while(1){
13        if(digitalRead(sensorPin) == LOW){ // The sensor is blocked
14            digitalWrite(ledPin, HIGH); //Make GPIO output HIGH level
15            printf("led turned on >>>\n"); //Output information on terminal
16        }
17        else { // The sensor is not blocked
18            digitalWrite(ledPin, LOW); //Make GPIO output LOW level
19            printf("led turned off <<<\n"); //Output information on terminal
20        }
21    }
22 }
```

## Project 29.2 Hall Sensor and Buzzer

This project uses Hall sensor to make a simple magnetic field detection sound and light alarm.

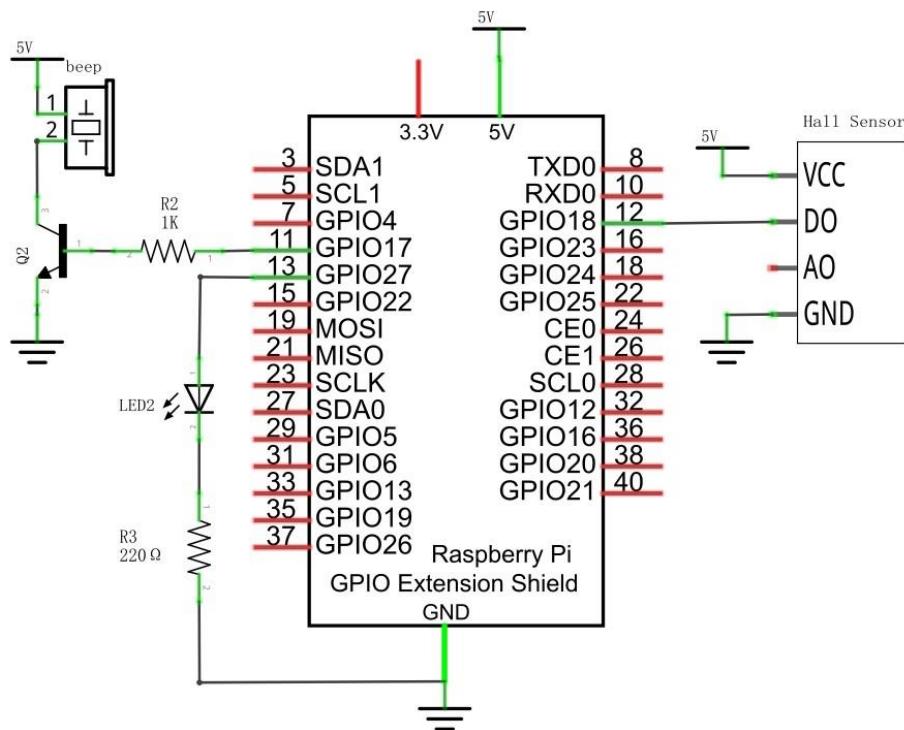

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x10 		
Active buzzer x1 	NPN transistor x1 (S8050) 	LED x1 	
Hall sensor x1 	Resistor 220Ω x1 	Resistor 1kΩ x1 	Speaker x1 

For the above two hall sensors, their difference is only the pin sequence is different, please get the Hall sensor, check its sequence, change the corresponding wiring, so as not to cause permanent damage to your raspberry PI.

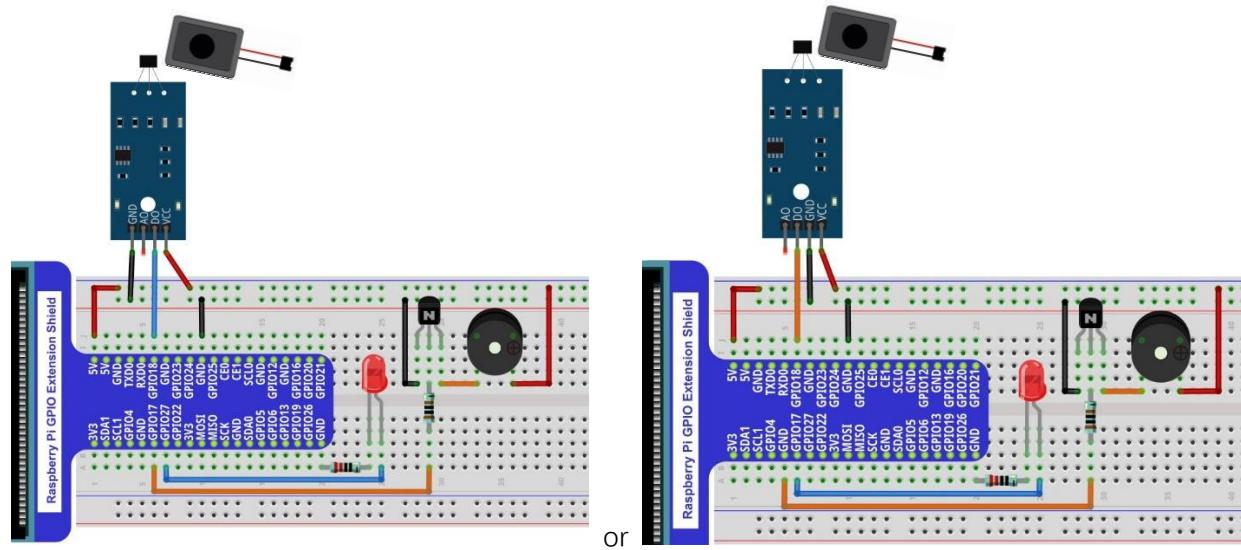

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

Please check the sequence of your Hall sensor and select the appropriate wiring to avoid permanent damage to your raspberry PI.

## Code

### C Code 29.2.1 Alertor

First observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter 29.2.1\_Alertor directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/29.2.1_Alertor
```

2. Use following command to compile " Alertor.c" and generate executable file "Alertor".

```
gcc Alertor.c -o Alertor -lwiringPi
```

3. Run the generated file " Alertor"

```
sudo ./Alertor
```

After the program is executed, every time the sensor is close to the magnetic field (speaker) by hand, the buzzer will sound an alarm, and the LED will flash to remind.

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <stdlib.h>
4 #define ledPin    0 //define the ledPin
5 #define sensorPin 1 //define the buttonPin
6 #define buzzerPin 2 //define the buzzerPin
7
8 void alarm(int times){

# Chapter 30 Infrared Obstacle Avoidance Sensor

In this chapter, we will learn how to use infrared obstacle avoidance sensor.

## Project 30.1 Infrared obstacle avoidance sensor and LED

This project uses infrared obstacle avoidance sensor to change the state of LED.

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x6 	
Infrared obstacle avoidance sensor x1 	LED x1 	Resistor 220Ω x1 

### Component knowledge

#### Infrared obstacle avoidance sensor

The infrared obstacle avoidance sensor module is a distance adjustable obstacle avoidance sensor. The sensor has strong adaptability to ambient light and high precision. It has a pair of infrared emitting and receiving tubes. The transmitting tube emits infrared rays of a certain frequency. When the detection direction encounters an obstacle (reflecting surface), the infrared rays are reflected back and are received by the receiving tube. The indicator light is on at this time. After the circuit processing, the signal output pin outputs digital signal. The detection distance can be adjusted by the potentiometer knob, the effective distance is 2 ~ 30cm, and the detection angle is 35°.

This module has 3 pins: signal pin, power positive pin and power negative pin. When the positive and negative pins of the module are connected to a suitable power supply, the module starts to work. At this time, only one pin on the development board is needed to read the output signal of the module. When the module is in use, the detection distance can be adjusted to a suitable value through the potentiometer knob. You can use your hand to block the module at a certain distance. When the infrared obstacle avoidance sensor is blocked, the signal pin outputs a low level; if the infrared obstacle avoidance sensor is not blocked, it outputs a high level.

Below is the pinout of infrared obstacle avoidance sensor.

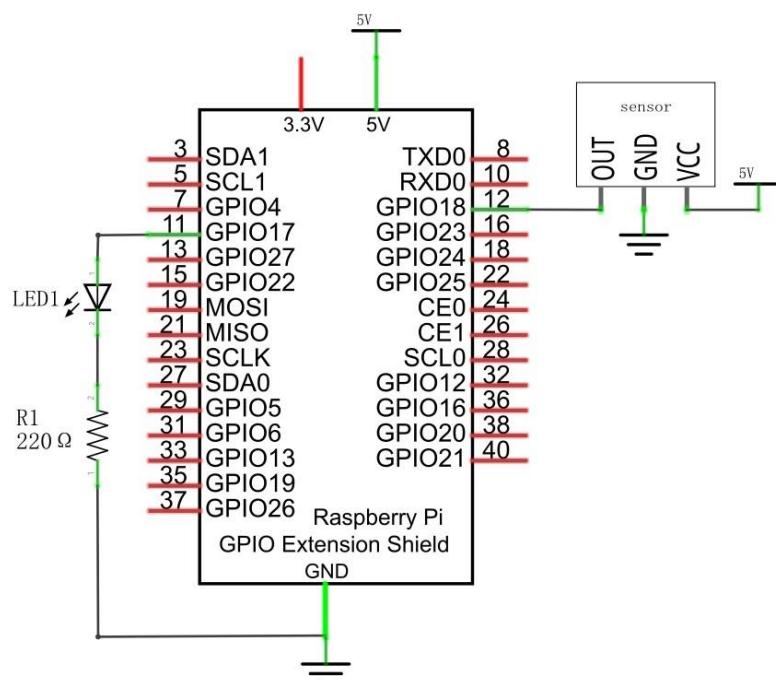

Pin description:

symbol	Function
<b>OUT</b>	Output control signal
<b>VCC</b>	Power supply pin, +3.3V~5.0V
<b>GND</b>	GND

Please do not use the voltage beyond the power supply range to avoid damage to the infrared obstacle avoidance sensor.

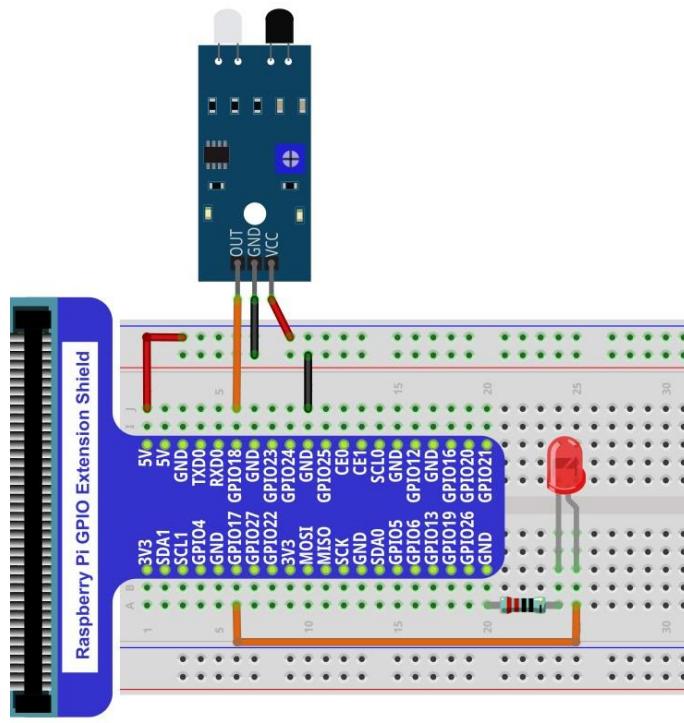

## Circuit

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

### C Code 30.1.1 InfraredSensor

First observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter 30.1.1\_InfraredSensor directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/30.1.1_InfraredSensor
```

2. Use following command to compile " InfraredSensor.c" and generate executable file " InfraredSensor ".

```
gcc InfraredSensor.c -o InfraredSensor -lwiringPi
```

3. Run the generated file "InfraredSensor "

```
sudo ./InfraredSensor
```

After the program is executed, when you block the sensor with your hand at a certain distance or the sensor encounters an obstacle, the LED will turn on, and when the sensor is not blocked or the sensor does not encounter an obstacle, the LED will turn off.

The following is the program code:

1	#include <wiringPi.h>
2	#include <stdio.h>
3	#define ledPin 0 //define the ledPin
4	#define sensorPin 1 //define the sensorPin
5	
6	void main(void)

```
7  {
8      printf("Program is starting ... \n");
9      wiringPiSetup(); //Initialize wiringPi.
10     pinMode(ledPin, OUTPUT); //Set ledPin to output
11     pinMode(sensorPin, INPUT); //Set sensorPin to input
12     while(1) {
13         if(digitalRead(sensorPin) == LOW) {
14             digitalWrite(ledPin, HIGH); //Make GPIO output HIGH level
15             printf("led turned on >>>\n"); //Output information on terminal
16         }
17         else {
18             digitalWrite(ledPin, LOW); //Make GPIO output LOW level
19             printf("led turned off <<<\n"); //Output information on terminal
20         }
21     }
22 }
```

## Project 30.2 Infrared obstacle avoidance sensor and buzzer

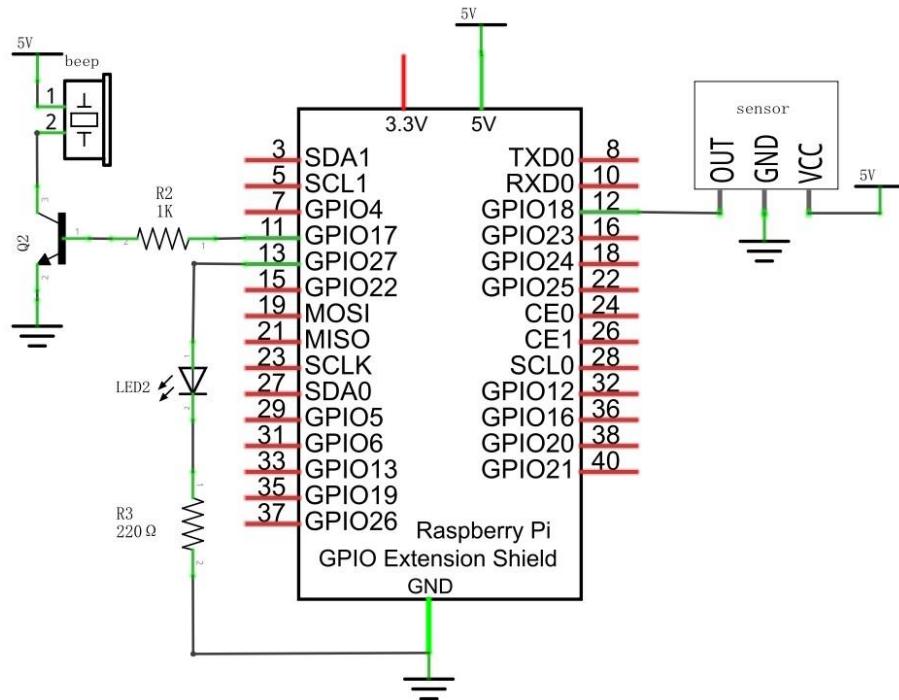

This project uses an infrared obstacle avoidance sensor to make a simple reminder.

### Component List

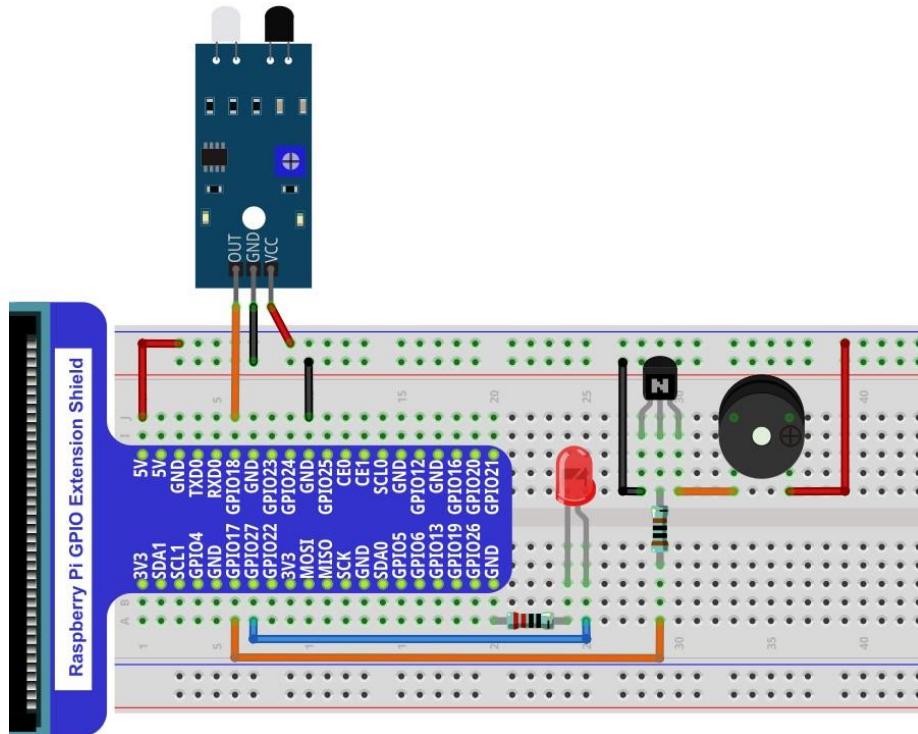

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x10 	
Active buzzer x1 	NPN transistor x1 (S8050) 	Resistor 1kΩx1 
Infrared obstacle avoidance sensor x1 	LED x1 	Resistor 220Ωx1 

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

### C Code 30.2.1 Alertor

First observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter 30.2.1\_Alertor directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/30.2.1_Alertor
```

2. Use following command to compile " Alertor.c" and generate executable file "Alertor".

```
gcc Alertor.c -o Alertor -lwiringPi
```

3. Run the generated file " Alertor"

```
sudo ./Alertor
```

After the program is executed, when you block the sensor with your hand at a certain distance or the sensor encounters an obstacle, the buzzer will sound a reminder, and the LED will flash to remind you.

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <stdlib.h>
4 #define ledPin    0 //define the ledPin
5 #define sensorPin 1 //define the buttonPin
6 #define buzzerPin 2 //define the buzzerPin
7
8 void alarm(int times){
9     while(times--) {
10         digitalWrite(buzzerPin, HIGH);
11         digitalWrite(ledPin, HIGH);
12         delay(50);
13         digitalWrite(buzzerPin, LOW);
14         digitalWrite(ledPin, LOW);
15         delay(50);
16     }
17 }
18
19 void sensorEven(void) {
20     alarm(3);
21 }
22 void main(void)
23 {
24     printf("Program is starting ... \n");
25     wiringPiSetup();           //Initialize wiringPi.
26     pinMode(ledPin, OUTPUT);  //Set ledPin to output
27     pinMode(sensorPin, INPUT); //Set sensorPin to input
```

```
28  pinMode(buzzerPin, OUTPUT);
29  delay(100);
30  wiringPiISR(sensorPin, INT_EDGE_FALLING, &sensorEven);
31  digitalWrite(buzzerPin, LOW);
32  while(1) {
33  }
34 }
```

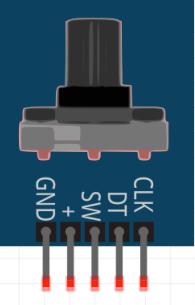

# Chapter 31 Rotary Encoder

In this chapter, we will learn how to use rotary encoder.

## Project 31.1 Rotary Encoder

This project uses a rotary encoder to make a simple counter.

### Component List

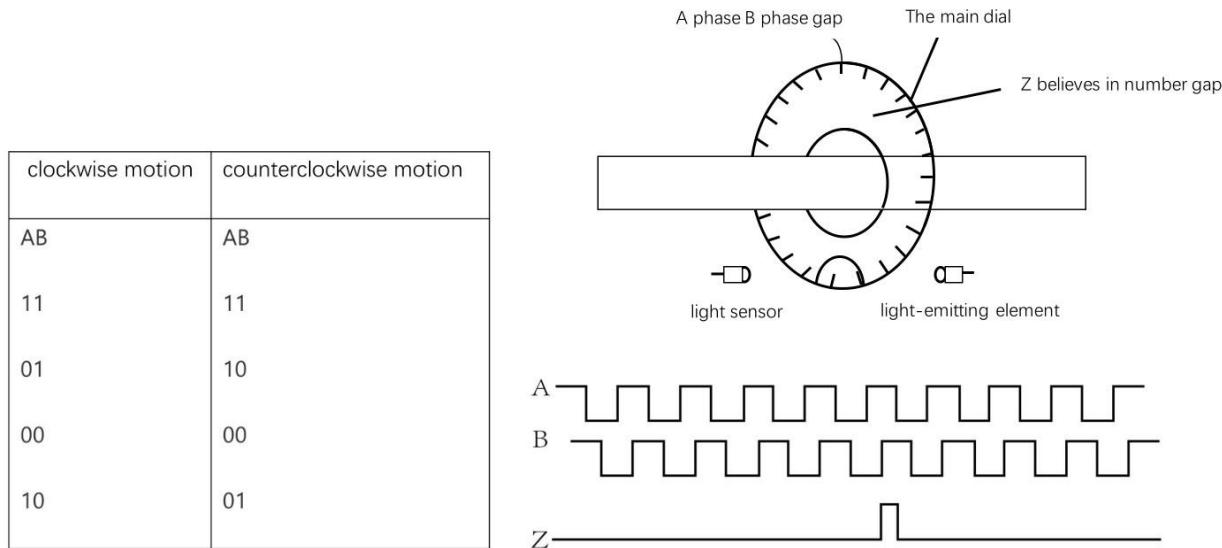

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x7
Rotary encoder x1	

### Component knowledge

#### Rotary Encoder

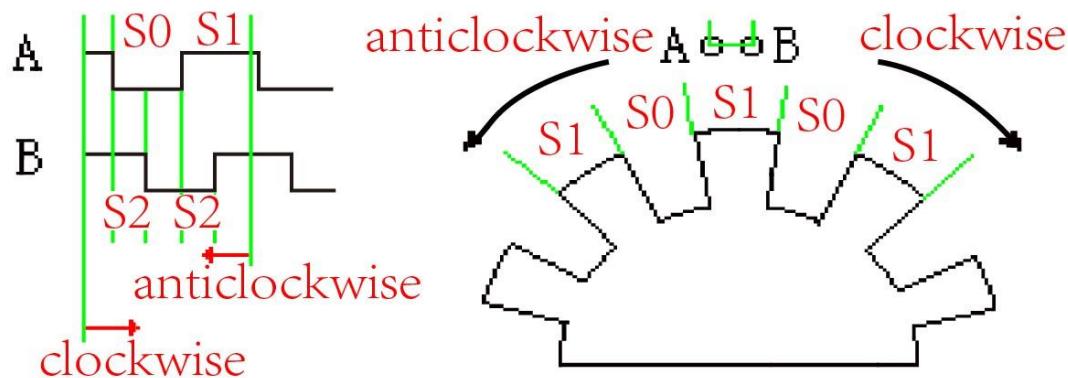

A rotary encoder is a rotary sensor that converts the rotational displacement into a periodic electrical signal, and then converts the electrical signal into a count pulse, and uses the number of pulses to indicate the magnitude of the rotational displacement. It drives the internal grating disc to rotate through the rotation of the knob. Many slits are preset on the grating disc. The rotation of the grating disc causes the light passing through the slits to produce pulse changes. After the signal is processed by the subsequent circuit, it is output as a pulse signal. Finally, The rotary displacement of the knob can be obtained through the output of the signal pin. The encoder generates pulse signals through the configuration of the internal light source and photosensitive element.

The working principle of the encoder and the schematic diagram of the output waveform are as follows:

A rotary encoder gives two-phase square waves, which are  $90^\circ$  out of phase, commonly referred to as A channel and B channel. One of the channels gives the information related to the rotation speed. The information of the rotation direction is obtained by sequentially comparing the signals of the two channels. There is also a special signal called Z or zero channel, which gives the absolute zero position of the encoder. This signal is a square wave that coincides with the center line of the A channel square wave.

The following is the internal cross-sectional structure diagram of the encoder:

The number of pulses per revolution of the rotary encoder in this project is 20. Its working voltage is 5V. The sensor has 5 pins: SW, CLK, DT, power supply positive pin and power supply negative pin. Among them, the SW pin is the input signal pin, the rotary encoder sensor itself is also a button, when the button is pressed, the SW pin will jump from high level to low level. The CLK pin is a rotation signal pin. When not rotating, this pin outputs a high level, and when rotating, it outputs a low level. The DT pin is used to determine the direction of rotation. If this pin is high when it is not rotating, and becomes low when it is rotating, it means that clockwise rotation has occurred. When this pin is high when it is rotating, it means that counterclockwise rotation has occurred. When the positive and negative pins of the module are connected to a suitable power supply, the module starts to work. At this time, three pins on the development board need to be used to read the SW, CLK and DT of the module respectively. Then according to the above principle, the state of the rotary encoder can be determined.

For example, when you turn the encoder clockwise by hand, the CLK outputs low level, and the DT changes from high level to low level. When you rotate the encoder counterclockwise by hand, the CLK outputs low

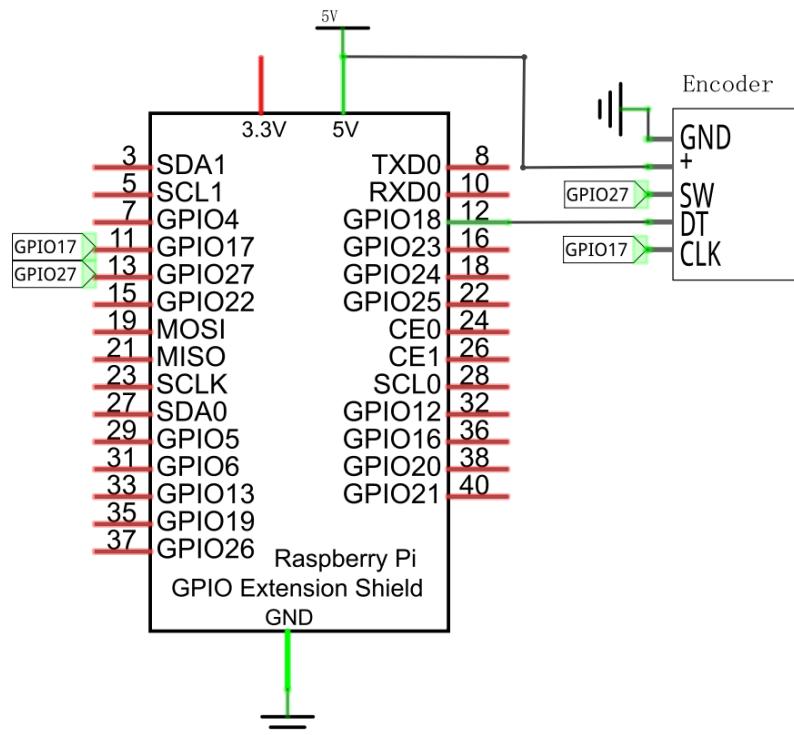

---

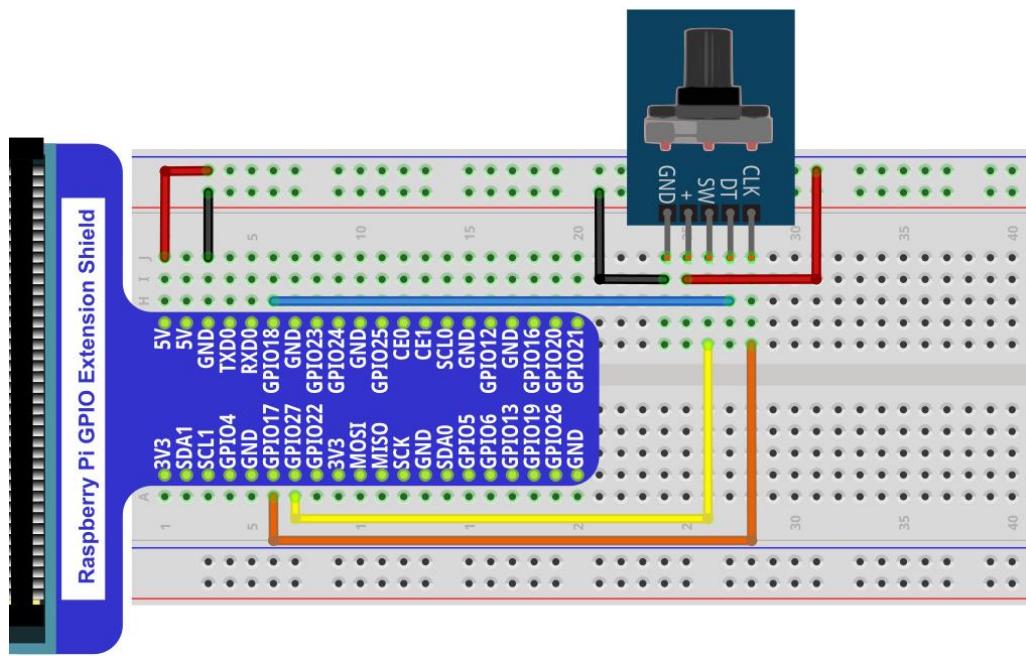

level, and the DT changes from low level to high level. When you press the rotary encoder by hand, the SW signal outputs low level.

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

### C Code 31.1.1 RotaryEncoder

First observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: [support@freenove.com](mailto:support@freenove.com)

1. Use cd command to enter 31.1.1\_RotaryEncoder directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/31.1.1_RotaryEncoder
```

2. Use following command to compile "RotaryEncoder.c" and generate executable file "RotaryEncoder".

```
gcc RotaryEncoder.c -o RotaryEncoder -lwiringPi
```

3. Run the generated file "RotaryEncoder".

```
sudo ./RotaryEncoder
```

After the program is executed, the rotary encoder can count the number of output pulses during the forward and reverse rotation. When the rotary encoder is rotated clockwise by hand, the count value will increase. When the rotary encoder is rotated counterclockwise by hand, the count value will decrease. When the rotary encoder is pressed by hand, it can be reset to the initial state, that is, the count starts from 0.

The following is the program code:

```

1 #include <wiringPi.h>
2 #include <stdio.h>
3
4 #define clkPin 0 //define the clkPin
5 #define dtPin 1 //define the dtPin
6 #define swPin 2 //define the swPin
7
8 int symbol = 0;
9 int lastDTStatus = 0;
10 int currentDTStatus = 0;
11 int previousCounterValue= 0;
12 int currentCounterValue=0;
13 void rotaryDeal() {
14     int symbol= 0;
15     int lastDTStatus= 0;
16     int currentDTStatus= 0;
17     lastDTStatus =digitalRead(dtPin);
18     while(digitalRead(clkPin) == LOW) {
19 // When not rotating, the value of GPIO.input (clkPin) is 1, and it will become 0 when
20 // rotating.
21         currentDTStatus = digitalRead(dtPin); //Record the current value when rotating
22         symbol = 1;
23     }
24     if(symbol==1) { // When rotating the encoder by hand
25         symbol = 0;
26     }
27 }
```

```
25     if ((lastDTStatus == 1) && (currentDTStatus == 0)) {
26         //When rotate clockwise, the angular displacement increases, and the count value increases.
27         previousCounterValue=previousCounterValue+1;
28     }
29     if ((lastDTStatus == 0) && (currentDTStatus == 1)) {
30         // When rotate counterclockwise, the angular displacement decreases, and the count value
31         previousCounterValue=previousCounterValue-1;
32     }
33 }
34 }
35
36 void main(void)
37 {
38     printf("Program is starting... \n");
39     wiringPiSetup() ; //Initialize wiringPi.
40     pinMode(clkPin, INPUT); //Set clkPin to input
41     pinMode(dtPin, INPUT); //Set dtPin to input
42     pinMode(swPin, INPUT); //Set swPin to input
43     pullUpDnControl(swPin, PUD_UP); //pull up to high level
44
45     while(1) {
46         rotaryDeal();
47         if(digitalRead(swPin) == LOW) {
48             delay(120);
49             if(digitalRead(swPin) == LOW) {
50                 // When the rotary encoder is pressed by hand, the count value is reset to zero.
51                 previousCounterValue=0;
52             }
53         }
54         if(currentCounterValue != previousCounterValue) {
55             printf("Counter= %d\n" , previousCounterValue);//
56             currentCounterValue = previousCounterValue;
57         }
58     }
59 }
```

Function `rotaryDeal()` is used to determine whether the rotary encoder is rotating, and when there is rotation, determine whether it is rotating clockwise or counterclockwise. Use variable `previousCounterValue` to record the number of rotations. When rotating clockwise, the variable increases, and when rotating counterclockwise, the variable decreases.

```
void rotaryDeal() {
    int symbol= 0;
```

```
int lastDTStatus= 0;
int currentDTStatus= 0;
lastDTStatus =digitalRead(dtPin);

while(digitalRead(clkPin) == LOW) {
// When not rotating, the value of GPIO.input (clkPin) is 1, and it will become 0 when
rotating.
    currentDTStatus = digitalRead(dtPin); //Record the current value when rotating
    symbol = 1;
}
if(symbol==1){           // When rotating the encoder by hand
    symbol = 0;
    if ((lastDTStatus == 1) && (currentDTStatus == 0)){
//When rotate clockwise, the angular displacement increases, and the count value increases.
        previousCounterValue=previousCounterValue+1;
    }
    if ((lastDTStatus == 0) && (currentDTStatus == 1)){
// When rotate counterclockwise, the angular displacement decreases, and the count value
decreases.
        previousCounterValue=previousCounterValue-1;
    }
}
}
```

Read the SW signal pin of the rotary encoder, and determine whether the rotary encoder is pressed. If it is pressed, the variable previousCounterValue is cleared.

```
if(digitalRead(swPin) == LOW) {
    delay(120);
    if(digitalRead(swPin) == LOW) {
// When the rotary encoder is pressed by hand, the count value is reset to zero.
        previousCounterValue=0;
    }
}
```

## Project 31.2 Rotary Encoder and LED

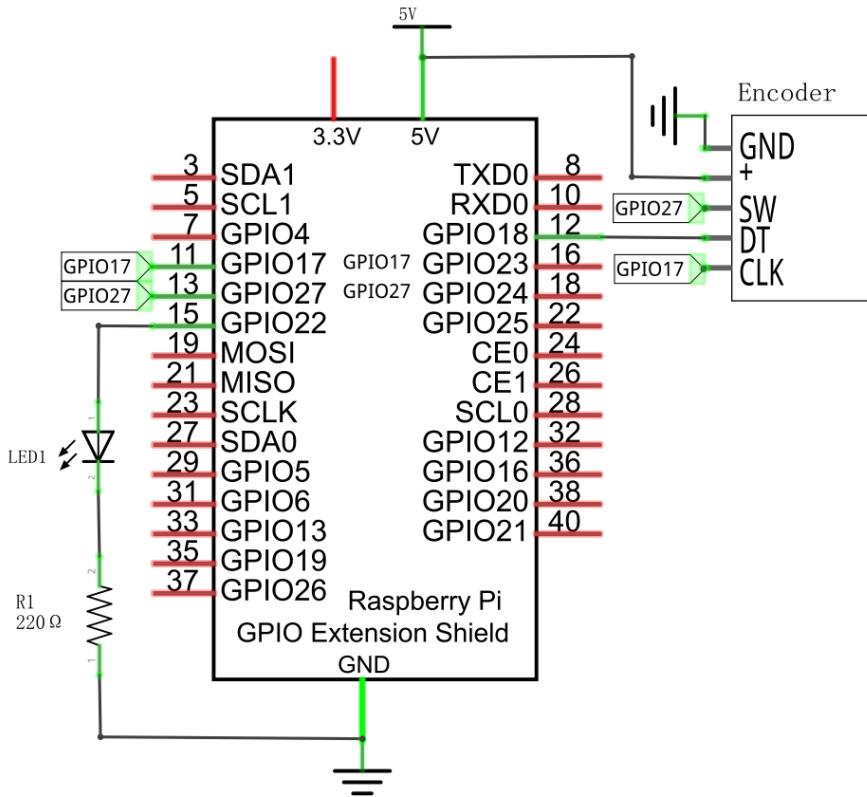

This project uses a rotary encoder to adjust the LEDs to emit different brightness.

### Component List

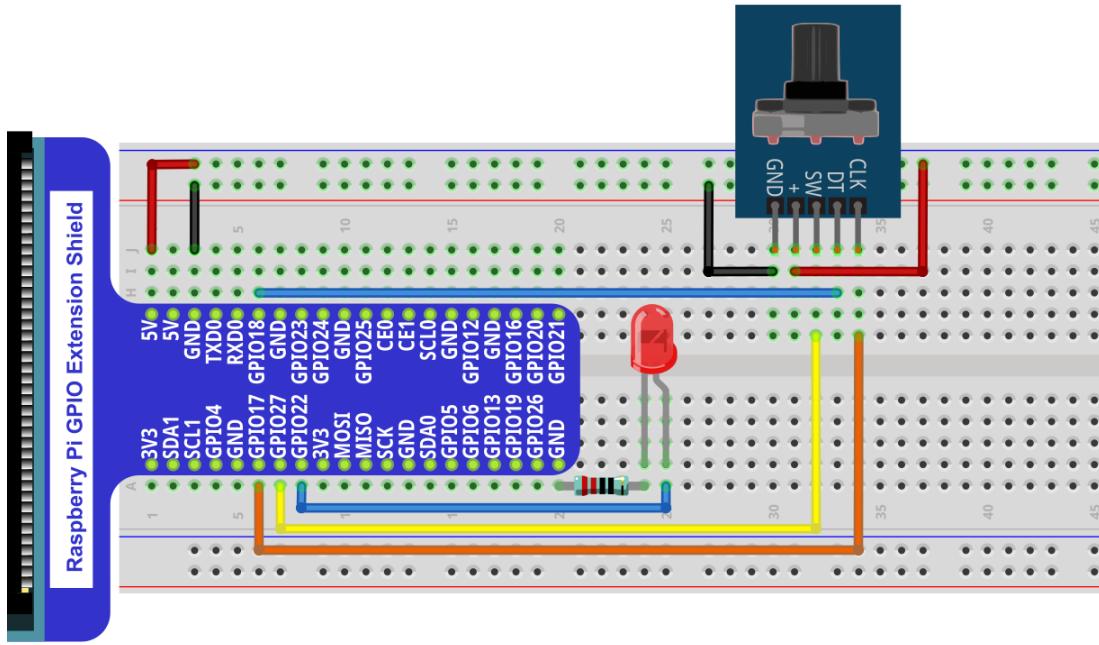

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x8 	
Rotary encoder x1 	LED x1 	Resistor 220Ω x1 

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

# Code

## C Code 31.2.1 Dimmable

First observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: support@freenove.com

1. Use cd command to enter 30.2.1\_Dimmable directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/31.2.1_Dimmable
```

2. Use following command to compile "Dimmable.c" and generate executable file "Dimmable".

```
gcc Dimmable.c -o Dimmable -lwiringPi
```

3. Run the generated file "Dimmable"

```
sudo ./Dimmable
```

After the program is executed, the rotary encoder can count the number of output pulses during forward and reverse rotation. Adjust the LED to emit different brightness by the number of rotations. When the rotary encoder is rotated clockwise by hand, the brightness of the led will increase, when the rotary encoder is rotated counterclockwise by hand, the brightness of the led will decrease, and when the rotary encoder is pressed by hand, the led will turn off.

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <softPwm.h>
4
5 #define clkPin 0 // define the clkPin
6 #define dtPin 1 // define the dtPin
7 #define swPin 2 // define the swPin
8 #define ledPin 3 //define the ledPin
9
10 int symbol = 0;
11 int lastDTStatus = 0;
12 int currentDTStatus = 0;
13 int previousCounterValue= 0;
14 int currentCounterValue=0;
15
16 void rotaryDeal() {
17     int symbol= 0;
18     int lastDTStatus= 0;
19     int currentDTStatus= 0;
20     lastDTStatus =digitalRead(dtPin);
21
22     while(digitalRead(clkPin) == LOW) {
23 // When not rotating, the value of GPIO.input (clkPin) is 1, and it will become 0 when
rotating.
```

```
24     currentDTStatus = digitalRead(dtPin); // Record the current value when rotating.
25     symbol = 1;
26 }
27 if(symbol==1){ // When rotating the encoder by hand
28     symbol = 0;
29     if((lastDTStatus == 1) && (currentDTStatus == 0)){
30 //When rotate clockwise, the angular displacement increases, and the count value increases.
31         previousCounterValue=previousCounterValue+1;
32     }
33     if ((lastDTStatus == 0) && (currentDTStatus == 1)){
34 // When rotate counterclockwise, the angular displacement decreases, and the count value
35         previousCounterValue=previousCounterValue-1;
36     }
37 }
38 }
39
40 void main(void){
41     printf("Program is starting...\n");
42     wiringPiSetup(); //Initialize wiringPi.
43     pinMode(clkPin, INPUT); //Set buttonPin to input
44     pinMode(dtPin, INPUT); //Set buttonPin to input
45     pinMode(swPin, INPUT); //Set buttonPin to input
46     pullUpDnControl(swPin, PUD_UP); //pull up to high level
47     softPwmCreate(ledPin, 0, 100);
48
49     while(1){
50         rotaryDeal();
51         if(digitalRead(swPin) == LOW){
52             delay(120);
53             if(digitalRead(swPin) == LOW){
54 // When the rotary encoder is pressed by hand, the count value is cleared.
55                 previousCounterValue=0;
56             }
57         }
58         if(previousCounterValue>=100){
59             previousCounterValue=100;
60         }
61         if(previousCounterValue<=0){
62             previousCounterValue=0;
63         }
64         if(currentCounterValue != previousCounterValue){
65             printf("Counter= %d\n", previousCounterValue);//
66             currentCounterValue = previousCounterValue;
```

```

67     }
68     softPwmWrite(ledPin, previousCounterValue); //Mapping to PWM duty cycle
69 }
70 }
```

Function rotaryDeal() is used to determine whether the rotary encoder is rotating, and when there is rotation, determine whether it is rotating clockwise or counterclockwise. Use variable previousCounterValue to record the number of rotations. When rotating clockwise, the variable increases, and when rotating counterclockwise, the variable decreases.

```

void rotaryDeal() {
    int symbol= 0;
    int lastDTStatus= 0;
    int currentDTStatus= 0;
    lastDTStatus =digitalRead(dtPin);

    while(digitalRead(clkPin) == LOW) {
        // When not rotating, the value of GPIO0.input (clkPin) is 1, and it will become 0 when
        // rotating.
        currentDTStatus = digitalRead(dtPin); // Record the current value when rotating.
        symbol = 1;
    }

    if(symbol==1) { // When rotating the encoder by hand
        symbol = 0;
        if((lastDTStatus == 1) && (currentDTStatus == 0)) {
            //When rotate clockwise, the angular displacement increases, and the count value increases.
            previousCounterValue=previousCounterValue+1;
        }
        if ((lastDTStatus == 0) && (currentDTStatus == 1)) {
            // When rotate counterclockwise, the angular displacement decreases, and the count value
            // decreases.
            previousCounterValue=previousCounterValue-1;
        }
    }
}
```

Read the SW signal pin of the rotary encoder, and determine whether the rotary encoder is pressed. If it is pressed, the variable previousCounterValue is cleared.

```

if(digitalRead(swPin) == LOW) {
    delay(120);
    if(digitalRead(swPin) == LOW) {
        //When the rotary encoder is pressed by hand, the count value is cleared.
        previousCounterValue=0;
    }
}
```

The variable previousCounterValue is limited here, and the PWM duty cycle of ledPin is set to previousCounterValue. The duty cycle of PWM should be less than or equal to 100.

```
if(previousCounterValue>=100) {  
    previousCounterValue=100;  
}  
  
if(previousCounterValue<=0) {  
    previousCounterValue=0;  
}  
  
softPwmWrite(ledPin, previousCounterValue); //Mapping to PWM duty cycle
```

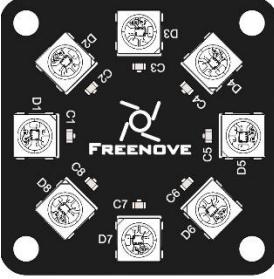

# Chapter 32 LEDpixel

In this chapter, we will learn Freenove 8 RGB LED Module

## Project 32.1 LEDpixel

This project will achieve an Freenove 8 RGB LED Module flowing water.

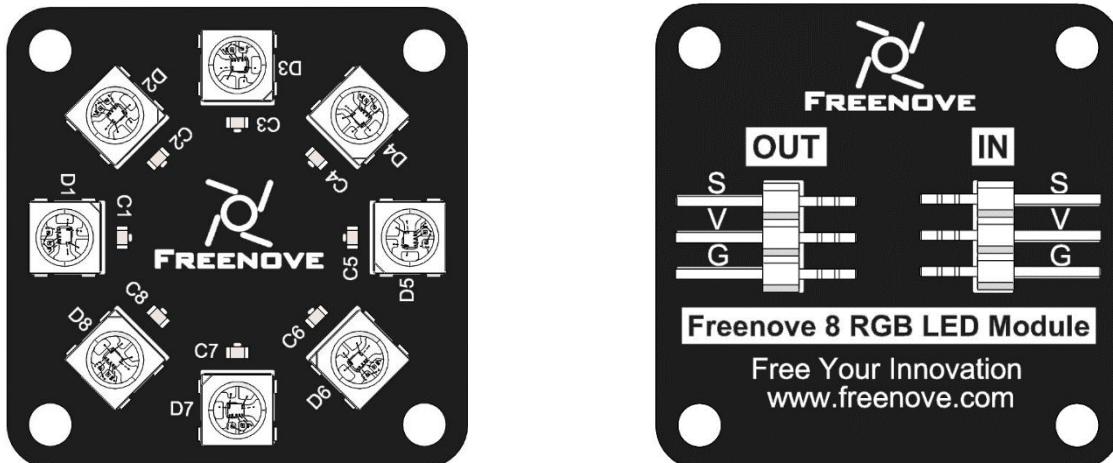

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x4
Freenove 8 RGB LED Module x1	

### Component knowledge

#### Freenove 8 RGB LED Module

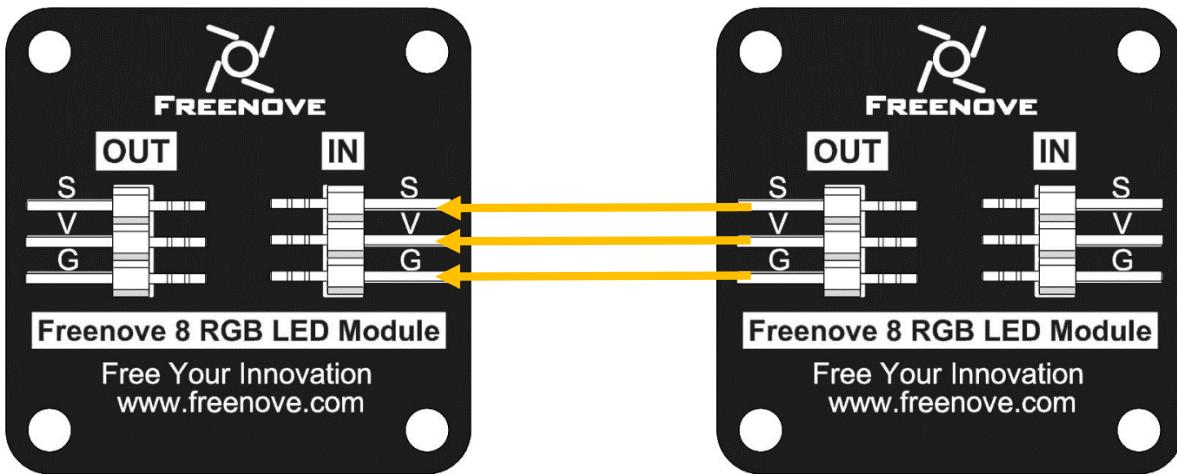

The Freenove 8 RGB LED Module is as below. You can use only one data pin to control the eight LEDs on the module. As shown below:

And you can also control many modules at the same time. Just connect OUT pin of one module to IN pin of

another module. In such way, you can use one data pin to control 8, 16, 32 ... LEDs.

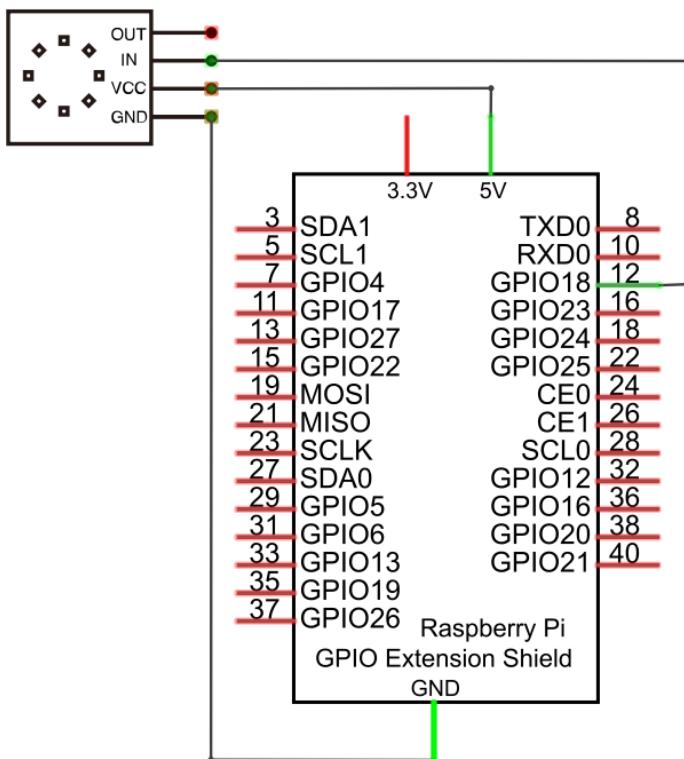

Pin description:

	(IN)		(OUT)
symbol	Function	symbol	Function
S	Input control signal	S	Output control signal
V	Power supply pin, +3.5V~5.5V	V	Power supply pin, +3.5V~5.5V
G	GND	G	GND

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Additional supplement

Raspberry Pi, other than 4B and 400, needs to disable the audio module, otherwise the LED will not work properly.

1. Create a new `snd-blacklist.conf` and open it for editing

```
sudo nano /etc/modprobe.d/snd-blacklist.conf
```

Add following content: After adding the contents, you need to press `Ctrl+O`, `Enter`, `Ctrl+Z`.

```
blacklist snd_bcm2835
```

pi@raspberrypi: ~

File Edit Tabs Help

```
GNU nano 5.4          /etc/modprobe.d/snd-blacklist.conf
blacklist snd_bcm2835
```

2. We also need to edit config file.

```
sudo nano /boot/config.txt
```

Find the contents of the following two lines (with `Ctrl + W` you can search):

```
# Enable audio (loads snd_bcm2835)
dtparam=audio=on
```

Add `#` to comment out the second line. Press `Ctrl+O`, `Enter`, `Ctrl+X`.

```
# Enable audio (loads snd_bcm2835)
# dtparam=audio=on
```

pi@raspberrypi: ~

```

It will take effect after restarting, restart your RPi.

If you want to restart the audio module, just restore the content modified in the above two steps.

## Code

### C Code 32.1.1 Ledpixel

Before running C code, please install WS281X library.

1. Enter the directory where the library locates:

```
cd ~/Freenove_Kit/Libs/C-Libs/libWS281X
```

2. Run the program

```
sudo sh ./build.sh
```

The installation is completed as shown in the figure below

```
pi@raspberrypi:~ $ cd ~/Freenove_Kit/Libs/C-Libs/libWS281X
pi@raspberrypi:~/Freenove_Kit/Libs/C-Libs/libWS281X $ sudo sh ./build.sh
build completed!
```

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please send an email to: support@freenove.com

1. Use cd command to enter 32.1.1\_Ledpixel directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/32.1.1_Ledpixel
```

2. Use following command to compile " Ledpixel.cpp" and generate executable file "Ledpixel".

```
sudo g++ Ledpixel.cpp -o Ledpixel -lwiringPi -IWS281X
```

3. Run the generated file " Ledpixel".

```
sudo ./Ledpixel
```

After the program runs, the LEDpixel will emit red, blue and green colors in turn like flowing water. If your Freenove 8 RGB LED Module doesn't work, you can try [additional supplements](#) to solve.

The following is the program code:

```
1 #include <wiringPi.h>
2 #include "Freenove_WS2812_Lib_for_Raspberry_Pi.hpp"
3 Freenove_WS2812 *a;
4 int constrain(int value, int min, int max) {
5     if (value>max) {
6         return max;
7     }
8     else if (value<min) {
9         return min;
10    }
11    else {
12        return value;
13    }
14 }
15 int main() {
16     printf("Program is starting ... \n");
17     while(1) {
18         int i;
```

```

19      a= new Freenove_WS2812(18, 8, GRB); //pin led_count type
20      a->set_Led_Brightness(50);
21      for(i=0;i<8;i++) {
22          a->set_Led_Color(i, 255, 0, 0);
23          a->show();
24          delay(100);
25      }
26      for(i=0;i<8;i++) {
27          a->set_Led_Color(i, 0, 255, 0);
28          a->show();
29          delay(100);
30      }
31      for(i=0;i<8;i++) {
32          a->set_Led_Color(i, 0, 0, 255);
33          a->show();
34          delay(100);
35      }
36      a->clear();
37  }
38  return 0;
39 }
```

Include "Freenove\_WS2812\_Lib\_for\_Raspberry\_Pi.hpp"

```
#include "Freenove_WS2812_Lib_for_Raspberry_Pi.hpp"
```

Create the object of the class and set the brightness to 50%. The eight LEDs will then light up red, green and blue in turn.

```

int main() {
    printf("Program is starting ... \n");
    int i;
    a= new Freenove_WS2812(18, 8, GRB); //pin led_count type
    a->set_Led_Brightness(50);
    for(i=0;i<8;i++) {
        a->set_Led_Color(i, 255, 0, 0);
        a->show();
        delay(100);
    }
    for(i=0;i<8;i++) {
        a->set_Led_Color(i, 0, 255, 0);
        a->show();
        delay(100);
    }
    for(i=0;i<8;i++) {
        a->set_Led_Color(i, 0, 0, 255);
```

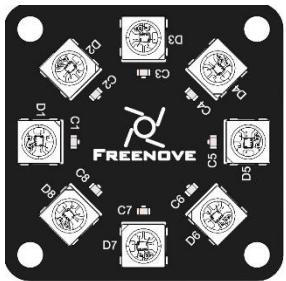

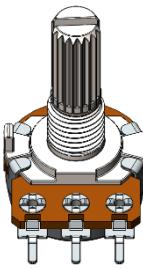

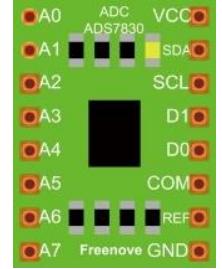

```
a->show();
delay(100);
}
a->clear();
return 0;
}
```

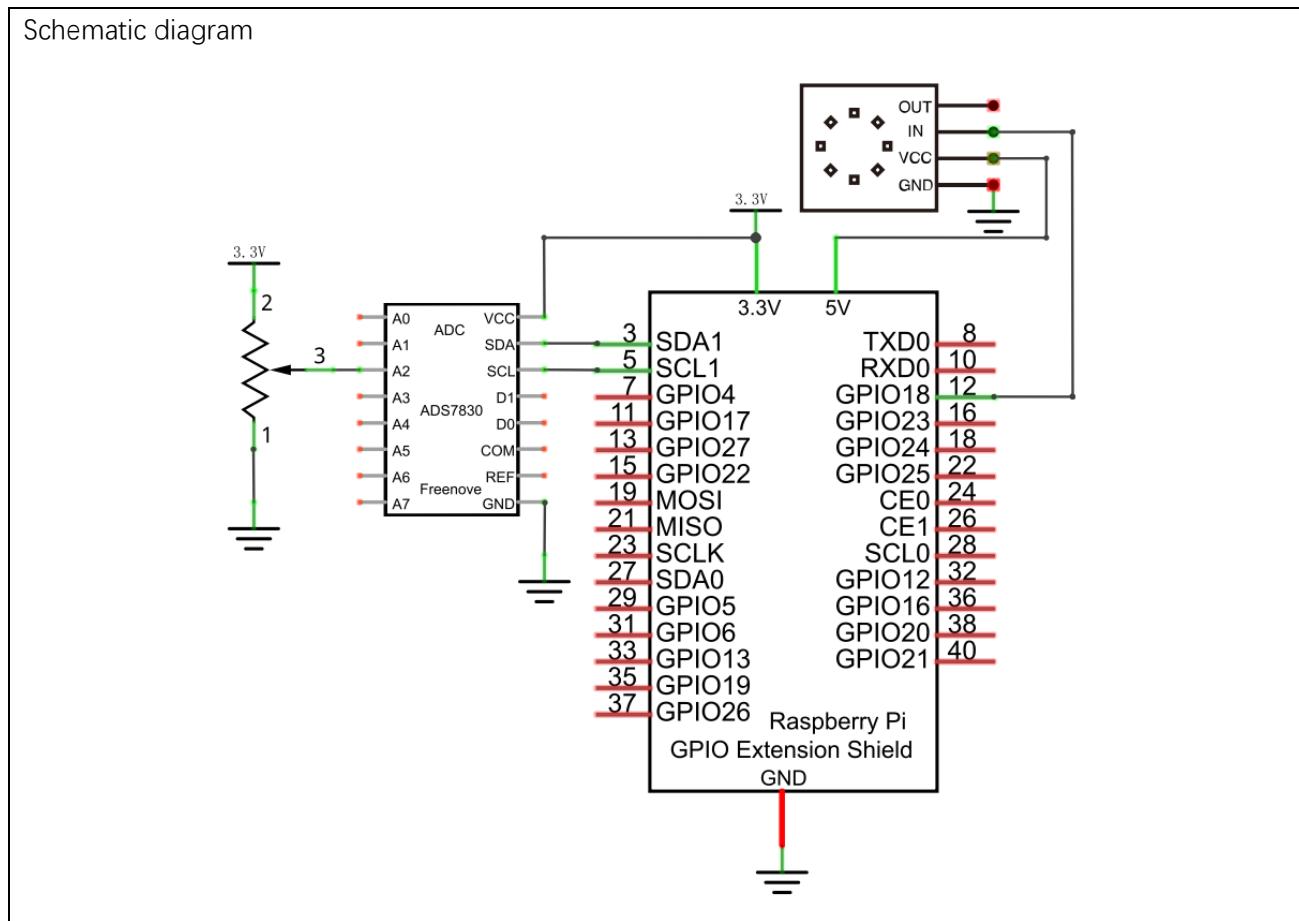

## Project 32.2 RainbowLight

In this project, we will learn to control the LED module with a potentiometer.

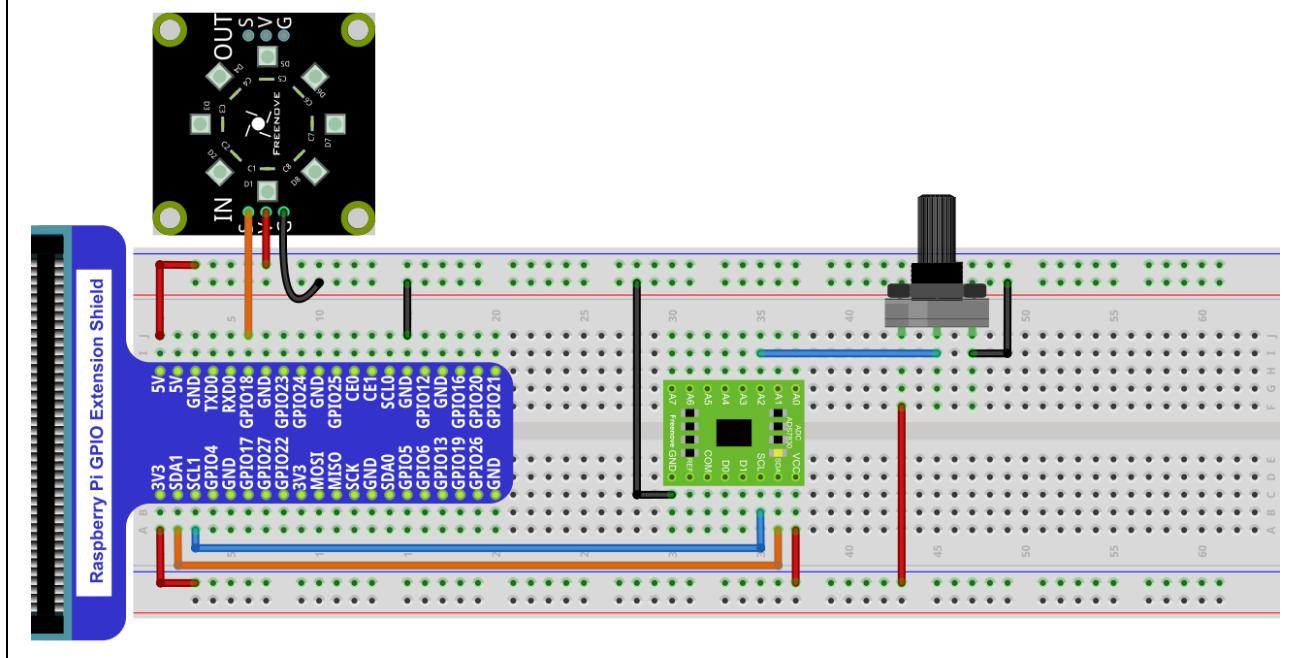

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x13 	
Freenove 8 RGB LED Module x1 	Rotary Potentiometer x1 	ADC Module x1 

### Circuit

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Code

In this project, we will make a Servo rotate from 0 degrees to 180 degrees and then reverse the direction to make it rotate from 180 degrees to 0 degrees and repeat these actions in an endless loop.

### C Code 32.2.1 RainbowLight

If you did not [configure I2C](#), please refer to [Chapter 7](#). If you did, please continue.

First, observe the project result, and then learn about the code in detail.

**If you have any concerns, please send an email to: [support@freenove.com](mailto:support@freenove.com)**

1. Use cd command to enter 32.2.1\_RainbowLight directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/32.2.1_RainbowLight
```

2. Use following command to compile "RainbowLight.cpp" and generate executable file "RainbowLight".

```
sudo g++ RainbowLight.cpp -o RainbowLight -IADCDevice -IWS281X -lwiringPi
```

3. Run the generated file "RainbowLight".

```
sudo ./RainbowLight
```

After running the program, you can change the color of the LED module by rotating the potentiometer.

The following is the program code:

```

1 #include <stdio.h>
2 #include <wiringPi.h>
3 #include <ADCDevice.hpp>
4 #include "Freenove_WS2812_Lib_for_Raspberry_Pi.hpp"
5 Freenove_WS2812 *led;
6 ADCDevice *adc;
```

```
7 int red, green, blue;
8 void HSL_RGB(int degree) {
9     degree=degree/360.0*255;
10    if (degree < 85) {
11        red = 255 - degree * 3;
12        green = degree * 3;
13        blue = 0;
14    }
15    else if (degree < 170) {
16        degree = degree - 85;
17        red = 0;
18        green = 255 - degree * 3;
19        blue = degree * 3;
20    }
21    else{
22        degree = degree - 170;
23        red = degree * 3;
24        green = 0;
25        blue = 255 - degree * 3;
26    }
27 }
28 int main() {
29     printf("Program is starting ... \n");
30     adc = new ADCDevice();
31     int i;
32     led= new Freenove_WS2812(18, 8, GRB); //pin led_count type
33     led->set_Led_Brightness(50);
34     if(adc->detectI2C(0x4b)){ // Detect the ads7830
35         delete adc; // Free previously pointed memory
36         adc = new ADS7830(0x4b); // If detected, create an instance of ADS7830.
37     }
38     else if(adc->detectI2C(0x48)){ // Detect the pcf8591.
39         delete adc; // Free previously pointed memory
40         adc = new PCF8591(); // If detected, create an instance of PCF8591.
41     }
42     else{
43         printf("No correct I2C address found, \n"
44             "Please use command 'i2cdetect -y 1' to check the I2C address! \n"
45             "Program Exit. \n");
46         return -1;
47     }
48     while(1){
49         for(i=0;i<8;i++){
50             int degree = (int)(adc->analogRead(2)/255.0*360+i*45); //read analog value of
```

```

A2 pin
51     if (degree > 360) {
52         degree=degree-360;
53     }
54     HSL_RGB(degree);
55     led->set_Led_Color(i, red, green, blue);
56     led->show();
57 }
58 }
59 return 0;
60 }
```

This function converts HSL colors to RGB colors.

```

void HSL_RGB(int degree){
    degree=degree/360.0*255;
    if (degree < 85) {
        red = 255 - degree * 3;
        green = degree * 3;
        blue = 0;
    }
    else if (degree < 170){
        degree = degree - 85;
        red = 0;
        green = 255 - degree * 3;
        blue = degree * 3;
    }
    else{
        degree = degree - 170;
        red = degree * 3;
        green = 0;
        blue = 255 - degree * 3;
    }
}
```

Read the ADC value of channel 2 in an infinite loop. Let the color of the eight LEDs change according to the value of the ADC.

```

while(1) {
    for(i=0;i<8;i++){
        int degree = (int)(adc->analogRead(2)/255.0*360+i*45); //read analog value of
A2 pin
        if (degree > 360) {
            degree=degree-360;
        }
        HSL_RGB(degree);
```

```
    led->set_Led_Color(i, red, green, blue);  
    led->show();  
}  
}
```

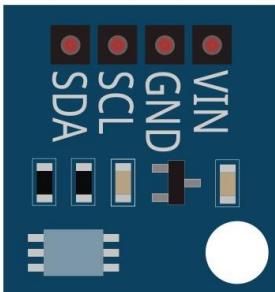

# Chapter 33 BMP180 Barometric Pressure Sensor

In this chapter, we will learn how to use BMP180 barometric pressure sensor.

## Project 33.1 Barometer

This project uses the BMP180 barometric pressure sensor to display real-time barometric pressure, temperature conditions and current altitude.

### Component List

Raspberry Pi (with 40 GPIO) x1 GPIO Expansion Board & Ribbon Cable x1 Breadboard x1	Jumper x6
BMP180 barometric pressure sensor x1	

### Component knowledge

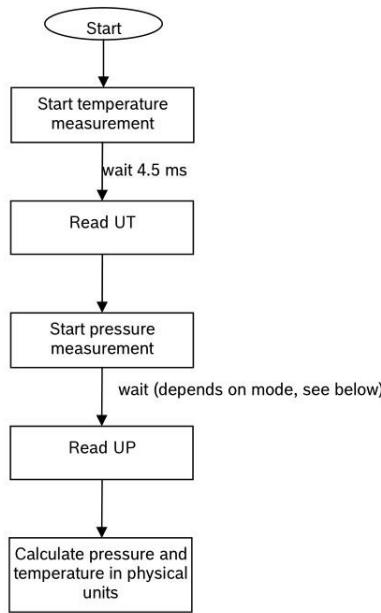

#### BMP180 barometric pressure sensor

The BMP180 barometric pressure sensor module is a high-precision barometric pressure sensor, which can detect temperature and barometric pressure, and through these two data, the current altitude can be calculated. Its pressure measurement range is from 300 to 1100 hPa (altitude 9000m to -500m), and temperature from -40°C to 85°C with an accuracy of  $\pm 1.0^{\circ}\text{C}$ . Using the BMP180 module to get altitude and barometric pressure requires math.

The BMP180 is designed to connect directly to the microcontroller via the IIC bus. The pressure and temperature data must be compensated by the BMP180's E2PROM calibration data. The BMP180 consists of a piezoresistive sensor, an analog-to-digital converter and a control unit with E2PROM and serial IIC interface. The BMP180 provides uncompensated pressure and temperature values. The E2PROM stores 176 bits of individual calibration data, which is used to compensate sensor for offset, temperature dependence and other parameters.

The general process of BMP180 reading data and the calculation of each data are as follows:

Among them, UT is temperature data (16 bits), and UP is pressure data (16 to 19 bits).

Calculate temperature:

calculate true temperature
X1 = (UT - AC6) * AC5 / 2 <sup>15</sup>
X2 = MC * 2 <sup>11</sup> / (X1 + MD)
B5 = X1 + X2
T = (B5 + 8) / 2 <sup>4</sup>

Calculate pressure:

calculate true pressure
B6 = B5 - 4000
X1 = (B2 * (B6 * B6 / 2 <sup>12</sup> )) / 2 <sup>11</sup>
X2 = AC2 * B6 / 2 <sup>11</sup>
X3 = X1 + X2
B3 = ((AC1*4+X3) << oss + 2) / 4
X1 = AC3 * B6 / 2 <sup>13</sup>
X2 = (B1 * (B6 * B6 / 2 <sup>12</sup> )) / 2 <sup>16</sup>
X3 = ((X1 + X2) + 2) / 2 <sup>2</sup>
B4 = AC4 * (unsigned long)(X3 + 32768) / 2 <sup>15</sup>
B7 = ((unsigned long)UP - B3) * (50000 >> oss)
if (B7 < 0x80000000) { p = (B7 * 2) / B4 }
else { p = (B7 / B4) * 2 }
X1 = (p / 2 <sup>8</sup> ) * (p / 2 <sup>8</sup> )
X1 = (X1 * 3038) / 2 <sup>16</sup>
X2 = (-7357 * p) / 2 <sup>16</sup>
p = p + (X1 + X2 + 3791) / 2 <sup>4</sup>

Calculate absolute altitude. According to the measured air pressure  $p$  and sea level air pressure  $p_0$  (for example, 1013.25hPa), the altitude in meters can be calculated via the following international pressure formula:

$$\text{altitude} = 44330 * \left( 1 - \left( \frac{p}{p_0} \right)^{\frac{1}{5.255}} \right)$$

Below is the pinout of BMP180 barometric pressure sensor.

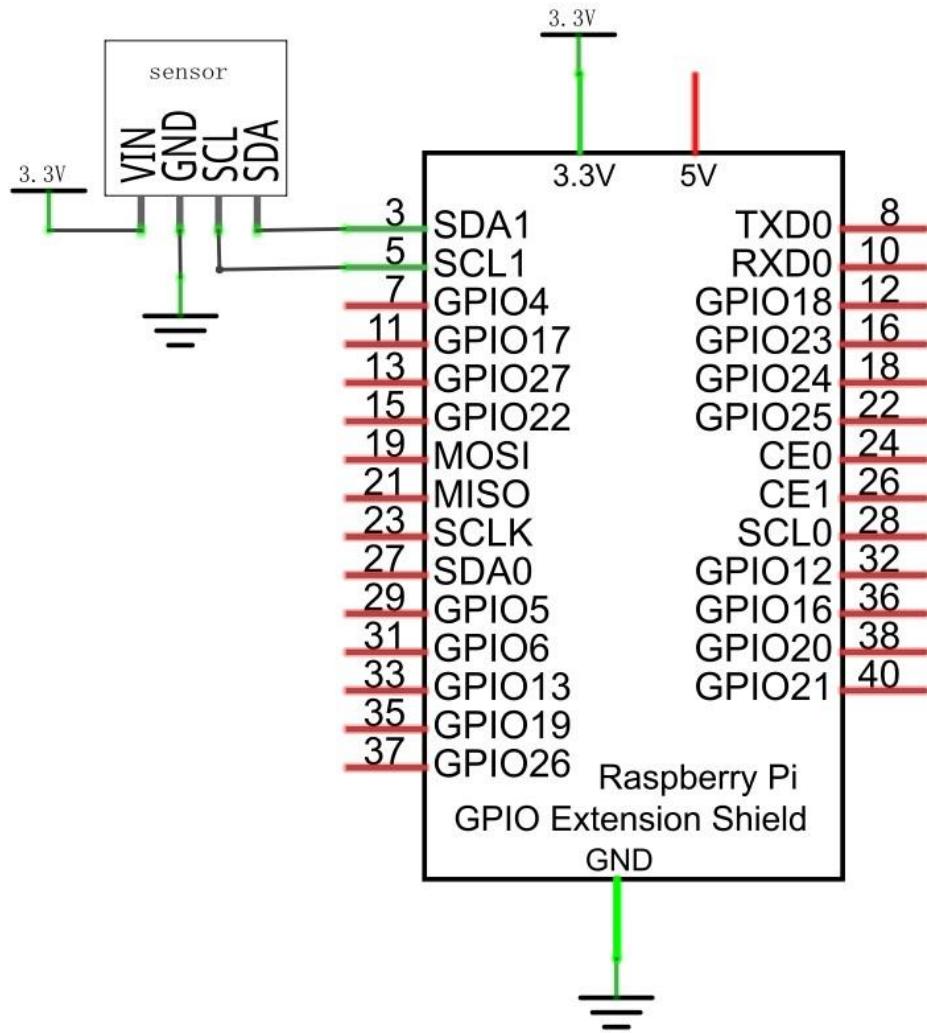

Pin description:

symbol	Function
VIN	Power supply pin, +1.6V~3.6V
GND	GND
SCL	Serial clock pin of I2C interface
SDA	Serial data pin of I2C interface

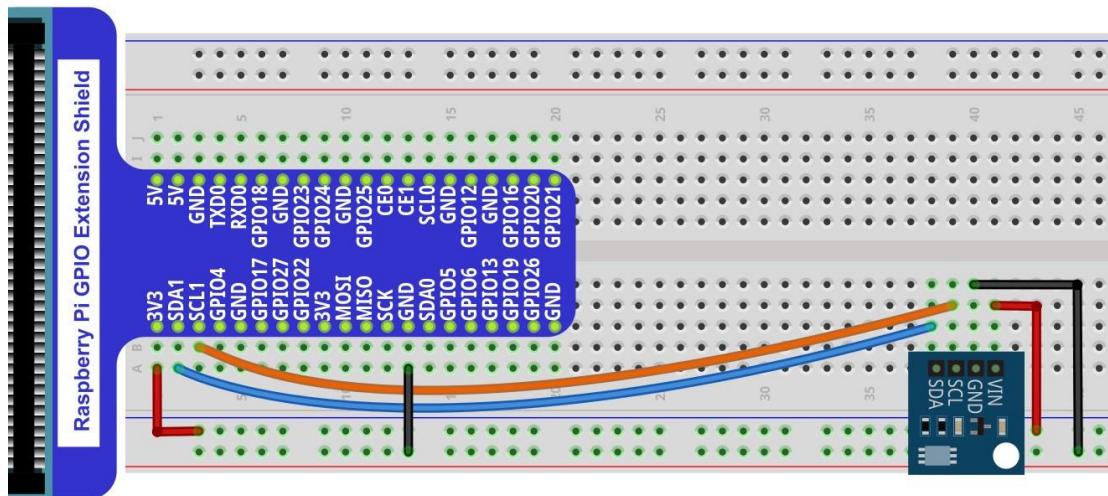

Please do not use voltage beyond the power supply range to avoid damage to the BMP180 barometric pressure sensor.

## Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

# Code

## C Code 33.1.1 Barometer

If you did not [configure I2C and Install Smbus](#), please refer to [Chapter 7](#). If you did, please move on.

First observe the project result, and then learn about the code in detail.

**If you have any concerns, please contact us via: support@freenove.com**

1. Use cd command to enter 33.1.1\_Barometer directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/33.1.1_Barometer
```

2. Use following command to compile "Barometer.c" and generate executable file "Barometer".

```
gcc -o Barometer ./smbus.c ./Barometer.c -lm
```

3. Run the generated file "Barometer"

```
sudo ./Barometer
```

After the program is executed, the terminal will display the current air pressure value, temperature value and altitude.

The following is the program code:

```
1 #include <stdio.h>
2 #include <stdint.h>
3 #include <fcntl.h>
4 #include <stdlib.h>
5 #include <unistd.h>
6 #include <linux/i2c-dev.h>
7 #include <linux/i2c.h>
8 #include <sys/ioctl.h>
9 #include "smbus.h"
10 #include <math.h>
11
12 #define bmp180_I2C_ADDRESS 0x77
13 const unsigned char bmp180_OVERSAMPLING_SETTING = 3;
14
15 // Calibration values – These are stored in the BMP180
16 short int ac1;
17 short int ac2;
18 short int ac3;
19 unsigned short int ac4;
20 unsigned short int ac5;
21 unsigned short int ac6;
22 short int b1;
23 short int b2;
24 short int mb;
25 short int mc;
26 short int md;
```

```
27 int b5;
28 unsigned int temperature, pressure, altitude;
29
30 // Open a connection to the bmp180
31 // Returns a file id
32 int bmp180_i2c_Begin() {
33     int fd;
34     char *fileName = "/dev/i2c-1";

143 // Value returned will be in units of 0.1 deg C
144 unsigned int bmp180_GetTemperature(unsigned int ut) {
145     int x1, x2;
146     x1 = (((int)ut - (int)ac6)*(int)ac5) >> 15;
147     x2 = ((int)mc << 11)/(x1 + md);
148     b5 = x1 + x2;
149     unsigned int result = ((b5 + 8)>>4);
150     return result;
151 }
152 // Arduino library. The number divided into pressure for
153 // float A is derived from the local pressure as explained
154 // at http://learn.adafruit.com/bmp180/using-the-bmp180.
155 unsigned int bmp180_Altitude(float pressure) {
156     float A = pressure/101325.0;
157     float B = 1/5.25588;
```

```

148     float C = pow(A, B) ;
149     C = 1 - C;
150     C = C / 0.0000225577;
151     return C;
152 }
153 int main(int argc, char **argv) {
154     printf("Program is starting ... \n");
155     while(1) {
156         bmp180_Calibration();
157         temperature = bmp180_GetTemperature(bmp180_ReadUT());
158         pressure = bmp180_GetPressure(bmp180_ReadUP());
159         altitude = bmp180_Altitude(pressure);
160         printf("Temperature\t%.1f °C\n", ((double)temperature)/10);
161         printf("Pressure\t%.2f hPa\n", ((double)pressure)/100);
162         printf("Altitude\t%.1f m\n\n", (double)altitude);
163         usleep(2000*1000);
164     }
165     return 0;
166 }
```

The function `bmp180_GetTemperature()` is used to calculate the current temperature value.

```

unsigned int bmp180_GetTemperature(unsigned int ut) {
    int x1, x2;
    x1 = (((int)ut - (int)ac6)*(int)ac5) >> 15;
    x2 = ((int)mc << 11)/(x1 + md);
    b5 = x1 + x2;
    unsigned int result = ((b5 + 8)>>4);
    return result;
}
```

The function `bmp180_GetPressure()` is used to calculate the current pressure value.

```

unsigned int bmp180_GetPressure(unsigned int up) {
    int x1, x2, x3, b3, b6, p;
    unsigned int b4, b7;
    b6 = b5 - 4000;
    // Calculate B3
    x1 = (b2 * (b6 * b6)>>12)>>11;
    x2 = (ac2 * b6)>>11;
    x3 = x1 + x2;
    b3 = (((((int)ac1)*4 + x3)<<bmp180_OVERSAMPLING_SETTING) + 2)>>2;
    // Calculate B4
    x1 = (ac3 * b6)>>13;
    x2 = (b1 * ((b6 * b6)>>12))>>16;
    x3 = ((x1 + x2) + 2)>>2;
```

```
b4 = (ac4 * (unsigned int)(x3 + 32768))>>15;
b7 = ((unsigned int)(up - b3) * (50000>>bmp180_OVERSAMPLING_SETTING));
if (b7 < 0x80000000)
    p = (b7<<1)/b4;
else
    p = (b7/b4)<<1;
x1 = (p>>8) * (p>>8);
x1 = (x1 * 3038)>>16;
x2 = (-7357 * p)>>16;
p += (x1 + x2 + 3791)>>4;
return p;
}
```

The function `bmp180_Altitude()` is used to calculate the current altitude.

```
unsigned int bmp180_Altitude(float pressure) {
    float A = pressure/101325.0;
    float B = 1/5.25588;
    float C = pow(A, B);
    C = 1 - C;
    C = C / 0.0000225577;
    return C;
}
```

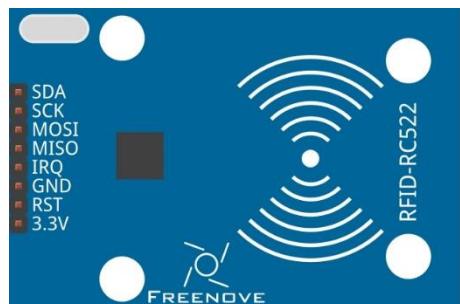

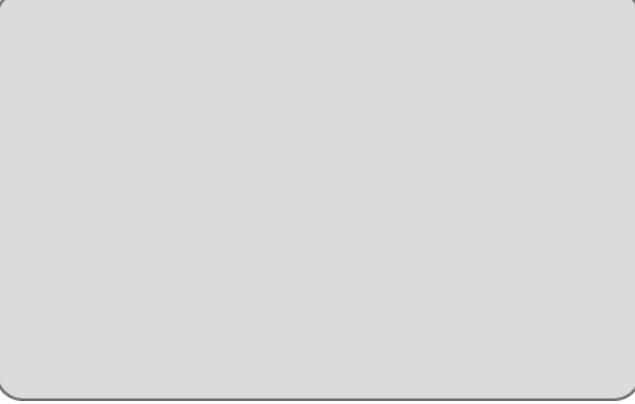

# Chapter 34 RFID

In this chapter, we will learn how to use RFID.

## Project 34.1 RFID

In this project, we will use RC522 RFID card reader to read and write the M1-S50 card.

### Component List

Raspberry Pi 3B x1 GPIO Extension Board & Wire x1 Breadboard x1 Jumper M/F x7	 A blue printed circuit board (PCB) labeled "RFID-RC522". It features several pins labeled SDA, SCK, MOSI, MISO, IRQ, GND, RST, and 3.3V. There are also two white circular pads at the top and bottom. A central area shows concentric arcs representing RF signals.
Mifare1 S50 Standard card x1	 A grey rectangular card with rounded corners, representing a standard Mifare1 S50 card.

## Component Knowledge

### RFID

RFID (Radio Frequency Identification) is a form of wireless communication technology. A complete RFID system is generally composed of a transponder and a reader. Generally, the transponder may be known as a tag, and each tag has a unique code, which is attached to an object to identify the target object. The reader is a device that reads (or writes) information in the tag.

Products derived from RFID technology can be divided into three categories: passive RFID products, active RFID products and semi active RFID products, among which, Passive RFID products are the earliest, the most mature and most widely used products in the market. It can be seen everywhere in our daily life such as, the bus card, dining card, bank card, hotel access cards, etc., and all of them are classified as close-range contact recognition. The main operating frequency of Passive RFID products are: 125KHZ (low frequency), 13.56MHZ (high frequency), 433MHZ (ultrahigh frequency), 915MHZ (ultrahigh frequency). Active and semi active RFID products work at higher frequencies.

The RFID module we use is a passive RFID product with the operating frequency of 13.56MHz.

### MFRC522

The MFRC522 is a highly integrated reader/writer IC for contactless communication at 13.56MHz.

The MFRC522's internal transmitter is able to drive a reader/writer antenna designed to communicate with ISO/IEC 14443 A/MIFARE cards and transponders without additional active circuitry. The receiver module provides a robust and efficient implementation for demodulating and decoding signals from ISO/IEC 14443 A/MIFARE compatible cards and transponders. The digital module manages the complete ISO/IEC 14443A framing and error detection (parity and CRC) functionality

This RFID Module uses MFRC522 as the control chip, and SPI (Peripheral Interface Serial) as the reserved interface.

#### Technical specs:

<b>Operating Voltage</b>	13-26mA(DC)\3.3V
<b>Idle current</b>	10-13mA(DC)\3.3V
<b>Sleep current in the</b>	<80uA
<b>Peak current</b>	<30mA
<b>Operating frequency</b>	13.56MHz
<b>Supported card type</b>	Mifare1 S50、Mifare1 S70、Mifare Ultralight、Mifare Pro、Mifare Desfire
<b>Size</b>	40mmX60mm
<b>Operation temperature</b>	20-80 degrees(Celsius)
<b>Storage temperature</b>	40-85 degrees (Celsius)
<b>Operation humidity</b>	5%-95%(Relative humidity)

### Mifare1 S50 Card

Mifare S50 is often called Mifare Standard with the capacity of 1K bytes. And each card has a 4-bytes global unique identifier number (USN/UID), which can be rewritten 100 thousand times and read infinite times. Its storage period can last for 10 years.

The Mifare S50 capacity (1K byte) is divided into 16 sectors (Sector0-Sector15). Each sector contains 4 data block (Block0-Block3. 64 blocks of 16 sectors will be numbered according absolute address, from 0 to 63).

And each block contains 16 bytes (Byte0-Byte15),  $64 \times 16 = 1024$ . As is shown in the following table:

Sector No.	Block No.	Storage area	Block type	Absolute block No.
sector 0	block 0	vendor code	vendor block	0
	block 1		data block	1
	block 2		data block	2
	block 3	Password A-access control-password B	control block	3
sector 1	block 0		data block	4
	block 1		data block	5
	block 2		data block	6
	block 3	Password A-access control-password B	control block	7
.....	.....	.....	.....	.....
sector 15	block 0		data block	60
	block 1		data block	61
	block 2		data block	62
	block 3	Password A-access control-password B	control block	63

Each sector has a set of independent password and access control put in its last block, that is, Block 3, which is also known as sector trailer. Sector 0, block 0 (namely absolute address 0) of S50 is used to store the card serial number and vendor code, which has been solidified and can't be changed. Except the manufacturer and the control block, the rest of the cards are data blocks, which can be used to store data. Data block can be used for two kinds of applications:

- (1) used as general data storage and can be operated for reading and writing data.
- (2) used as data value, and can be operated for initializing, adding, subtracting and reading the value.

The sector trailer block in each sector is the control block, including a 6-byte password A, a 4-byte access control and a 6-byte password B. For example, the control block of a brand new card is as follows:

A0 A1 A2 A3 A4 A5	FF 07 80 69	B0 B1 B2 B3 B4 B5
password A	access control	password B

The default password of a brand new card is generally 0A1A2A3A4A5 for password A and B0B1B2B3B4B5 for password B, or both the password A and password B are 6 FF. Access control is used to set the access conditions for each block (including the control block itself) in a sector.

Blocks of S50 are divided into data blocks and control blocks. There are four operations, "read", "write", "add value", "subtract value (including transmission and storage)" for data blocks, and there are two operations, "read" and "write" for control blocks.

For more details about how to set data blocks and control blocks, please refer to Datasheet.

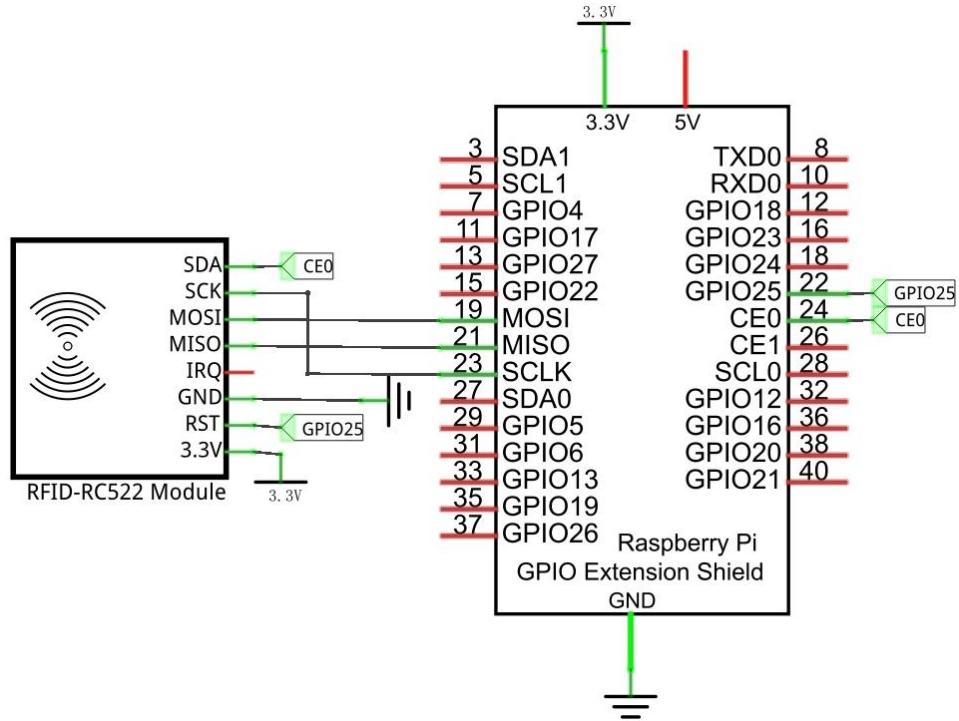

By default, after verifying password A or password B, we can do reading or writing operation to data blocks. And after verifying password A, we can do reading or writing operation to control blocks. But password A can never be read, so if you choose to verify password A but forget the password A, the block will never be able to read again. **It is highly recommended that beginners should not try to change the contents of control blocks.**

For Mifare1 S50 card equipped in Freenove RFID Kit, the default password A and B are both FFFFFFFFFF.

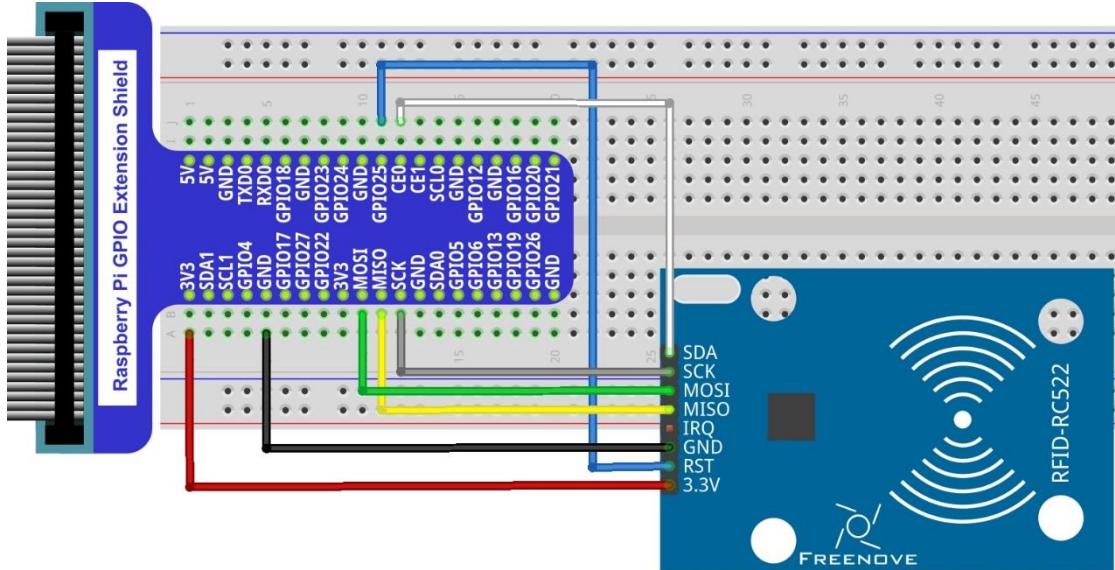

## Circuit

Schematic diagram:

Hardware connection. If you need any support, please feel free to contact us via: [support@freenove.com](mailto:support@freenove.com)

## Configure SPI

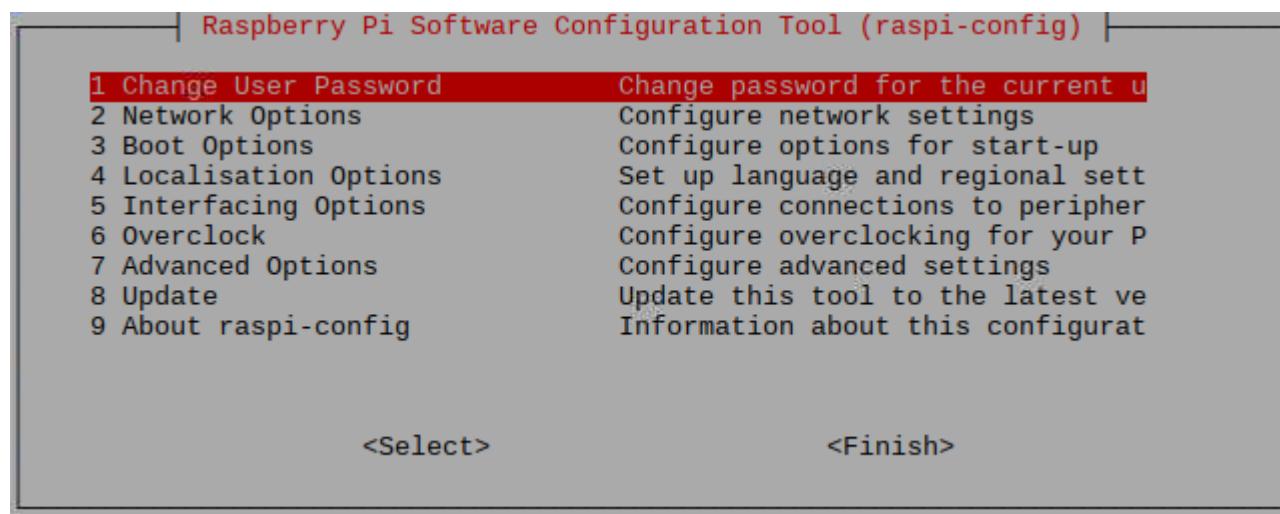

### Enable SPI

The SPI interface of raspberry pi is closed by default. You need to open it manually. You can enable the SPI interface in the following way.

Type the following command in the terminal:

```
sudo raspi-config
```

Then open the following dialog box:

Choose “5 Interfacing Options”→“P4 SPI”→“Yes”→“Finish” in order and then restart your RPi. Then the SPI module is started.

Type the following command to check whether the module SPI is loaded successfully:

```
ls /dev/sp*
```

The following result indicates that the module SPI has been loaded successfully:

```
pi@raspberrypi:~ $ ls /dev/sp*
/dev/spidev0.0  /dev/spidev0.1
```

## Code

The project code uses human-computer interaction command line mode to read and write the M1-S50 card.

### C Code 34.1.1 RFID

First observe the running result, and then learn about the code in detail.

**If you need any support, please contact us via: support@freenove.com**

1. Use cd command to enter RFID directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/34.1.1_RFID
```

2. Use the following command to compile and generate executable file "RFID".

```
sudo sh ./build.sh
```

3. Then run the generated file "RFID".

```
sudo ./RFID
```

After the program is executed, the following contents will be displayed in the terminal:

```
pi@raspberrypi:~/Freenove_Kit/Code/C_Code/24.1.1_RFID $ sudo sh ./build.sh
Build finished!
pi@raspberrypi:~/Freenove_Kit/Code/C_Code/24.1.1_RFID $ sudo ./RFID
Try to open device /dev/spidev0.0
Device opened
Device Number:3
SPI mode [OK]
SPI word bits[OK]
SPI max speed[OK]
User Space RC522 Application
RC522>■
```

Here, type the command “quit” to exit the program.

Type command “scan”, and then the program begins to detect whether there is a card close to the sensing area of MFRC522 reader. Place a M1-S50 card in the sensing area. The following results indicate that the M1-S50 card has been detected, the UID of which is E6CF5C8EFB (HEX).

```
RC522>scan
Scanning
.....
.....Card detected      0xE6 0xCF 0x5C 0x8E, Check Sum = 0xFB
Card Selected, Type:PICC_TYPE_MIFARE_1K
RC522>E6CF5C8E>■
```

When the Card is placed in the sensing area, you can read and write the card with the following command.

```
Usage:
    read <blockstart>
    dump
    halt
    clean <blockaddr>
    write <blockaddr> <data>
```

In the command `read<blockstart>`, the parameter `blockstart` is the address of the data block, and the range is 0-63. This command is used to display all the data from `blockstart` address to the end of the sector. For example, sector 0 contains data block 0,1,2,3. Using the command “`read 0`” can display all contents of data block 0,1,2,3. Using the command “`read 1`” can display all contents of data block 1,2,3. As is shown below:

```
RC522>E6CF5C8E>read 0
read
Auth Block (0x00) with key 0xFF 0xFF 0xFF 0xFF 0xFF ...OK
Read block address 0x00 ....OK read 144 bits
Read block address 0x01 ....OK read 144 bits
Read block address 0x02 ....OK read 144 bits
Read block address 0x03 ....OK read 144 bits
  0: e6 cf 5c 8e fb 08 04 00 62 63 64 65 66 67 68 69 : ..\.....bcdefghi
  16: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 : .....
  32: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 : .....
  48: 00 00 00 00 00 ff 07 80 69 ff ff ff ff ff ff : .....i.....
RC522>E6CF5C8E>read 1
read
Auth Block (0x01) with key 0xFF 0xFF 0xFF 0xFF 0xFF ...OK
Read block address 0x01 ....OK read 144 bits
Read block address 0x02 ....OK read 144 bits
Read block address 0x03 ....OK read 144 bits
  0: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 : .....
  16: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 : .....
  32: 00 00 00 00 00 00 ff 07 80 69 ff ff ff ff ff : .....i.....
RC522>E6CF5C8E>
```

Command “dump” is used to display the content of all data blocks in all sectors.

Command `<address> <data>` is used to write “`data`” to data block with address “`address`”, where the address range is 0-63 and the data length is 0-16. For example, if you want to write the string “Freenove” to the data block with address “1”, you can type the following command.

```
write 1 Freenove
RC522>E6CF5C8E>write 1 Freenove
write
Auth Block (0x01) with key 0xFF 0xFF 0xFF 0xFF 0xFF ...OK
Try to write block 1 with 8 byte data...OK
```

Read the contents of this sector and check the data just written.

```
read 0
```

The following results indicate that the string “Freenove” has been written successfully into the data block 1.

```
Read block address 0x03 ....OK read 144 bits
  0: e6 cf 5c 8e fb 08 04 00 62 63 64 65 66 67 68 69 : ..\.....bcdefghi
  16: 46 72 65 65 6e 6f 76 65 00 00 00 00 00 00 00 00 : Freenove.....
  32: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 : .....
  48: 00 00 00 00 00 ff 07 80 69 ff ff ff ff ff ff : .....i.....
```

Command “`clean <address>`” is used to remove the contents of the data block with address “`address`”. For example, if you want to clear the contents of the data block 1 that has just been written, you can type the following command.

```
clean 1
RC522>E6CF5C8E>clean 1
clean
Auth Block (0x01) with key 0xFF 0xFF 0xFF 0xFF 0xFF ...OK
Try to clean block 1...OK
```

Read the contents of data blocks in this sector again to check whether the data is erased. The following results indicate that the contents of data block 1 have been erased.

```
RC522>E6CF5C8E>read 0
read
Auth Block (0x00) with key 0xFF 0xFF 0xFF 0xFF 0xFF ...OK
Read block address 0x00 ....OK read 144 bits
Read block address 0x01 ....OK read 144 bits
Read block address 0x02 ....OK read 144 bits
Read block address 0x03 ....OK read 144 bits
  0: e6 cf 5c 8e fb 08 04 00 62 63 64 65 66 67 68 69 : ..\.....bcdefghi
  16: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 : .....
  32: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 : .....
  48: 00 00 00 00 00 ff 07 80 69 ff ff ff ff ff ff : .....i.....
```

Command "halt" is used to quit the selection state of the card.

```
RC522>E6CF5C8E>halt
halt
Halt
RC522>
```

The following is the program code:

```
1 #include <stdio.h>
2 #include <stdint.h>
3 #include <unistd.h>
4 #include <string.h>
5 #include <getopt.h>
6 #include <stdlib.h>
7 #include "mfrc522.h"
8 #define DISP_COMMANDLINE() printf("RC522>")
9
10 int scan_loop(uint8_t *CardID);
11 int tag_select(uint8_t *CardID);
12 int main(int argc, char **argv) {
13     MFRC522_Status_t ret;
14     //Recognized card ID
15     uint8_t CardID[5] = { 0x00, };
16     static char command_buffer[1024];
17
18     ret = MFRC522_Init('A');
19     if (ret < 0) {
20         perror("Failed to initialize");
21         exit(-1);
22     }
23
24     printf("User Space RC522 Application\r\n");
25
26     while (1) {
27         /*Main Loop Start*/
28         DISP_COMMANDLINE();
29     }
```

```
30     scanf("%s", command_buffer);
31     if (strcmp(command_buffer, "scan") == 0) {
32         puts("Scanning");
33         while (1) {
34             ret = MFRC522_Check(CardID);
35             if (ret != MI_OK) {
36                 printf(".");
37                 fflush(stdout);
38                 continue;
39             }
40             ret |= tag_select(CardID);
41             if (ret == MI_OK) {

```

```

117     CardID[0], CardID[1], CardID[2], CardID[3], CardID[4]);
118     ret_int = MFRC522_SelectTag(CardID);
119     if (ret_int == 0) {
120         printf("Card Select Failed\r\n");
121         return -1;
122     } else {
123         printf("Card Selected, Type:%s\r\n",
124             MFRC522_TypeToString(MFRC522_ParseType(ret_int)));
125     }
126     ret_int = 0;
127     return ret_int;
128 }
```

In the code, first initialize the MFRC522. If the initialization fails, the program will exit.

```

    ret = MFRC522_Init('A');
    if (ret < 0) {
        perror("Failed to initialize");
        exit(-1);
    }
```

In the main function, wait for the command input. If command "scan" is received, the function will begin to detect whether there is a card close to the sensing area. If a card is detected, the card will be selected and card UID will be acquired. Then enter the function scan\_loop (). If command "quit" or "exit" is received, the program will exit.

```

scanf("%s", command_buffer);
if (strcmp(command_buffer, "scan") == 0) {
    puts("Scanning");
    while (1) {
        ret = MFRC522_Check(CardID);
        if (ret != MI_OK) {
            printf(".");
            fflush(stdout);
            continue;
        }
        ret |= tag_select(CardID);
        if (ret == MI_OK) {
            ret = scan_loop(CardID);
            if (ret < 0) {
                goto END_SCAN;
            } else if (ret == 1) {
                goto HALT;
            }
        }
    }
    END_SCAN: printf("Card error... ");
    HALT: puts("Halt");
```

```

} else if (strcmp(command_buffer, "quit") == 0
           || strcmp(command_buffer, "exit") == 0) {
    return 0;
} else {
    puts("Unknown command");
    puts("scan:scan card and dump");
    puts("quit:exit program");
}
/*Main Loop End*/
}

```

The function `scan_loop()` will detect command read, write, clean, halt, dump and do the corresponding processing to each command. The functions of each command and the method have been introduced before.

```

int scan_loop(uint8_t *CardID) {

    while (1) {

        char input[32];
        int block_start;
        DISP_COMMANDLINE();
        printf("%02X%02X%02X%02X>", CardID[0], CardID[1], CardID[2], CardID[3]);
        scanf("%s", input);
        puts((char*)input);
        if (strcmp(input, "halt") == 0) {
            return 1;
        } else if (strcmp(input, "dump") == 0) {
            if (MFRC522_Debug_CardDump(CardID) < 0)
                return -1;
        } else if (strcmp(input, "read") == 0) {
            scanf("%d", &block_start);
            if (MFRC522_Debug_DumpSector(CardID, block_start) < 0) {
                return -1;
            }
        } else if (strcmp(input, "clean") == 0) {
            char c;
            scanf("%d", &block_start);
            while ((c = getchar()) != '\n' && c != EOF)
                ;
            if (MFRC522_Debug_Clean(CardID, block_start)) {
                return -1;
            }
        } else if (strcmp(input, "write") == 0) {
            char write_buffer[256];
            size_t len = 0;

```

```
scanf("%d", &block_start);
scanf("%s", write_buffer);
if (len >= 0) {
    if (MFRC522_Debug_Write(CardID, block_start, write_buffer,
        strlen(write_buffer)) < 0) {
        return -1;
    }
}
} else {
    printf(
        "Usage:\r\n" "\tread <blockstart>\r\n" "\tdump\r\n" "\thalt\r\n"
        "\tclean <blockaddr>\r\n" "\twrite <blockaddr> <data>\r\n");
    return 0;
}
}
return 0;
}
```

The header file "mfrc522.h" contains the associated operation method for the MFRC522. You can open the file to view all the definitions and functions.

# Chapter 35 Soldering a Circuit Board

From previous chapters, we have learned about electronic circuits and components and have built a variety of circuits using a Breadboard device, which is not designed to be used permanently. We now will take a further step to make permanent projects using a Perfboard (a type of Prototype Circuit Board). Note: Perfboard is a stiff, thin sheet of insulated material with holes bored on a grid. The grid is usually a squared off shape with a spacing of 0.1 inches. Square copper pads cover these holes to make soldering electronic components easier.

To finish this chapter, you need to prepare the necessary soldering equipment, including an electric soldering iron (or soldering pencil) and solder. We have already prepared the Perfboard for you.

**CAUTION: Please use extreme caution and attention to safety when you operate soldering tools used in these projects.**

## Project 35.1 Soldering a Buzzer

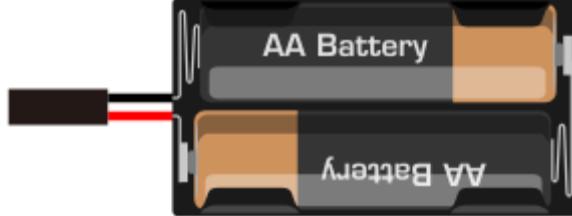

You should be familiar with the Buzzer from our previous project. We will solder a permanent circuit that when a Push Button Switch is pressed a Buzzer sounds

**Note:** This circuit **does not** require programming and will work when it is powered ON. When the button is not pressed and the Buzzer is not in use, there is no power consumption.

You can install it on your bicycle, your bedroom door or any other place where you want a Buzzer.

### Component list

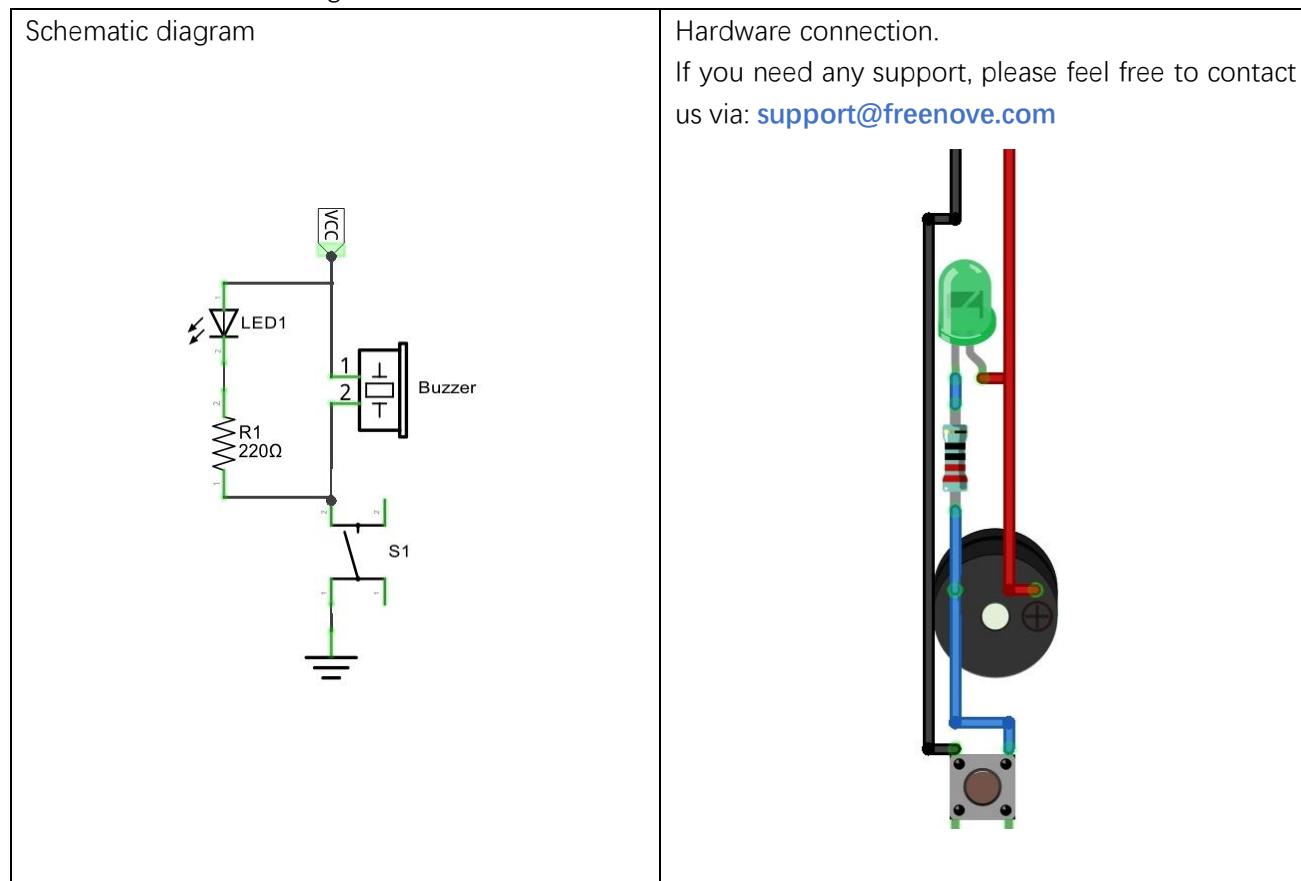

Female Pin Header x2	LED x1	Resistor 220Ω x1	Active buzzer x1	Push button x1
AA Battery Holder x1 and AA Batteries x2				

The diagram shows a black AA battery holder with two batteries. The top battery is labeled "AA Battery" and the bottom one is labeled "AA Battery". A red and black wire is connected to the positive terminal of the top battery.

## Circuit

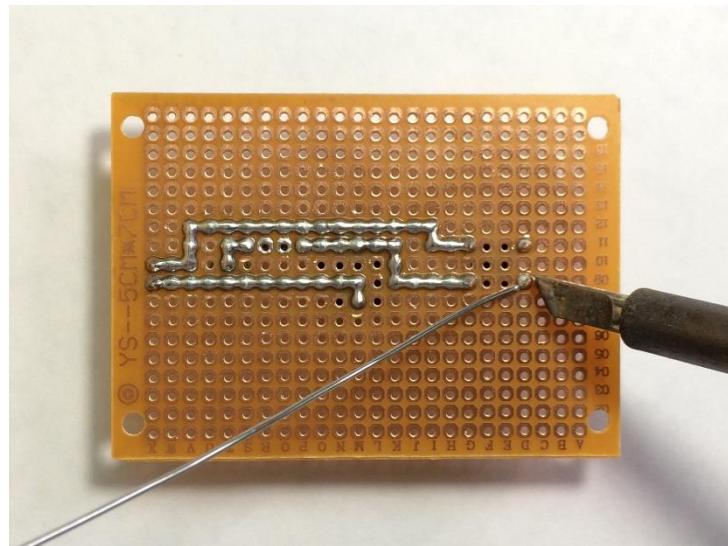

We will solder the following circuit on the Perfboard.

Note: If you are new to soldering electronic components on any type of circuit board we strongly recommend that you watch some instructional How-To videos by doing an Internet search and practice your soldering technique before attempting to solder the following projects. Some components can be damaged by exposure to excessive heat for prolonged times and there are various techniques you can learn that will help with making neater solder joints.

## Solder the Circuit

Insert the components in the Perfboard following the Hardware Connection image as a general visual guide. Insert the pins of the components (all from the same side) so that you have only the components on one side of the Perfboard and the pins on the other. Then from the side with the pins carefully solder the circuit on the backside without having excess solder shorting out any portions of the circuit.

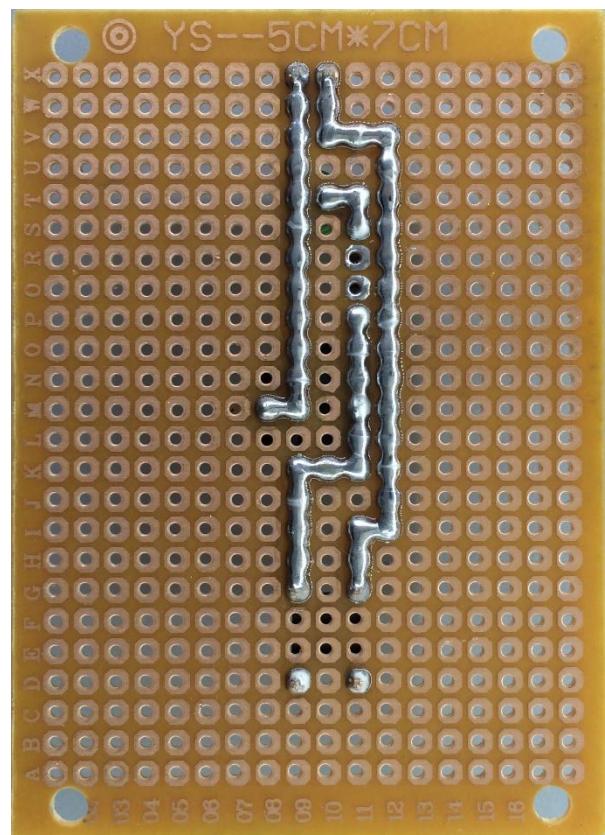

Here is a diagram after soldering from both sides of the Perfboard:

Front

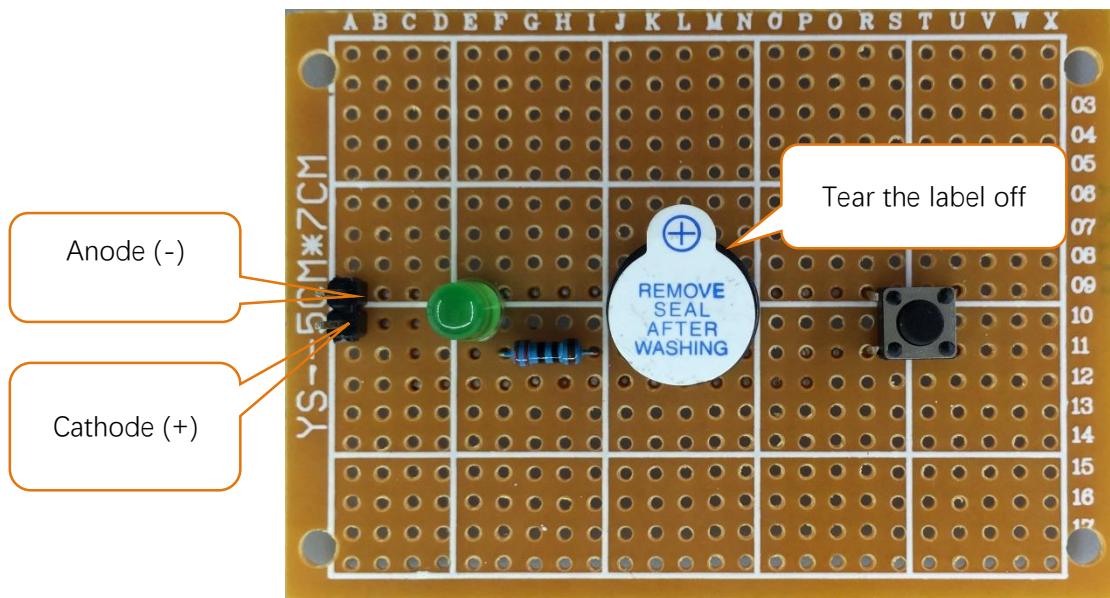

Back

## Test the Circuit

Connect the circuit board to a power supply (3~5V). You can use Raspberry Pi board or your 2 AA Cell Battery Box as the power supply.

Press the Push Button Switch after connecting the power and then the buzzer will sound.

## Project 35.2 Soldering a Flowing Water Light

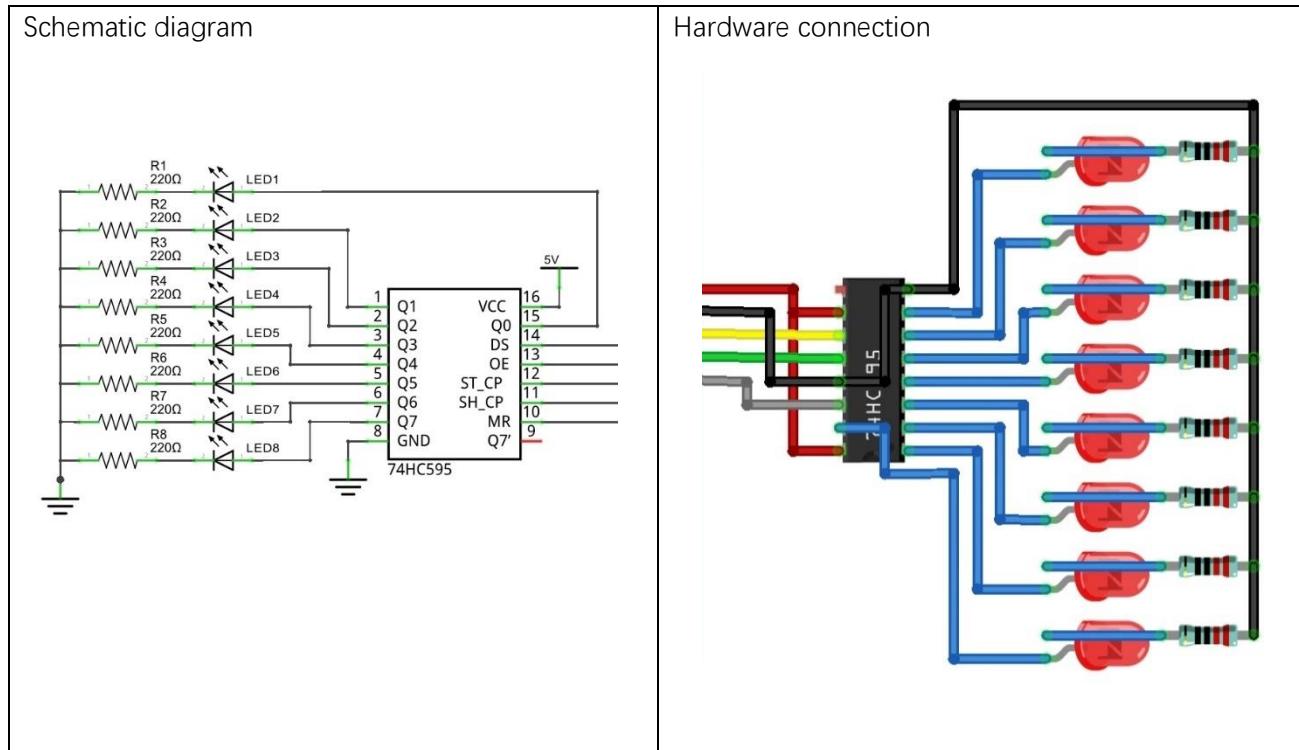

You should be familiar with the Flowing Water Light from our previous project. We will solder a permanent circuit using improved code to make a more interesting Flowing Water Light.

### Component List

Female Pin Header x5	Resistor 220Ω x8	LED x8	74HC595 x1

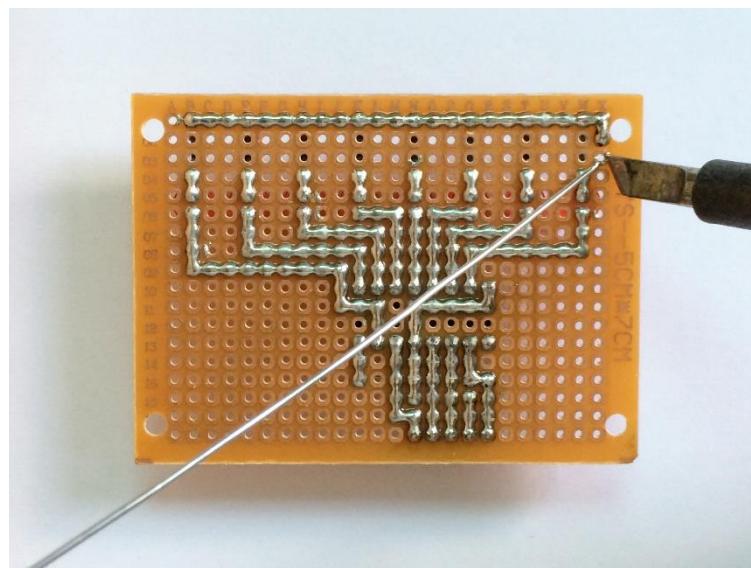

### Circuit

Solder the following circuit on the Perfboard.

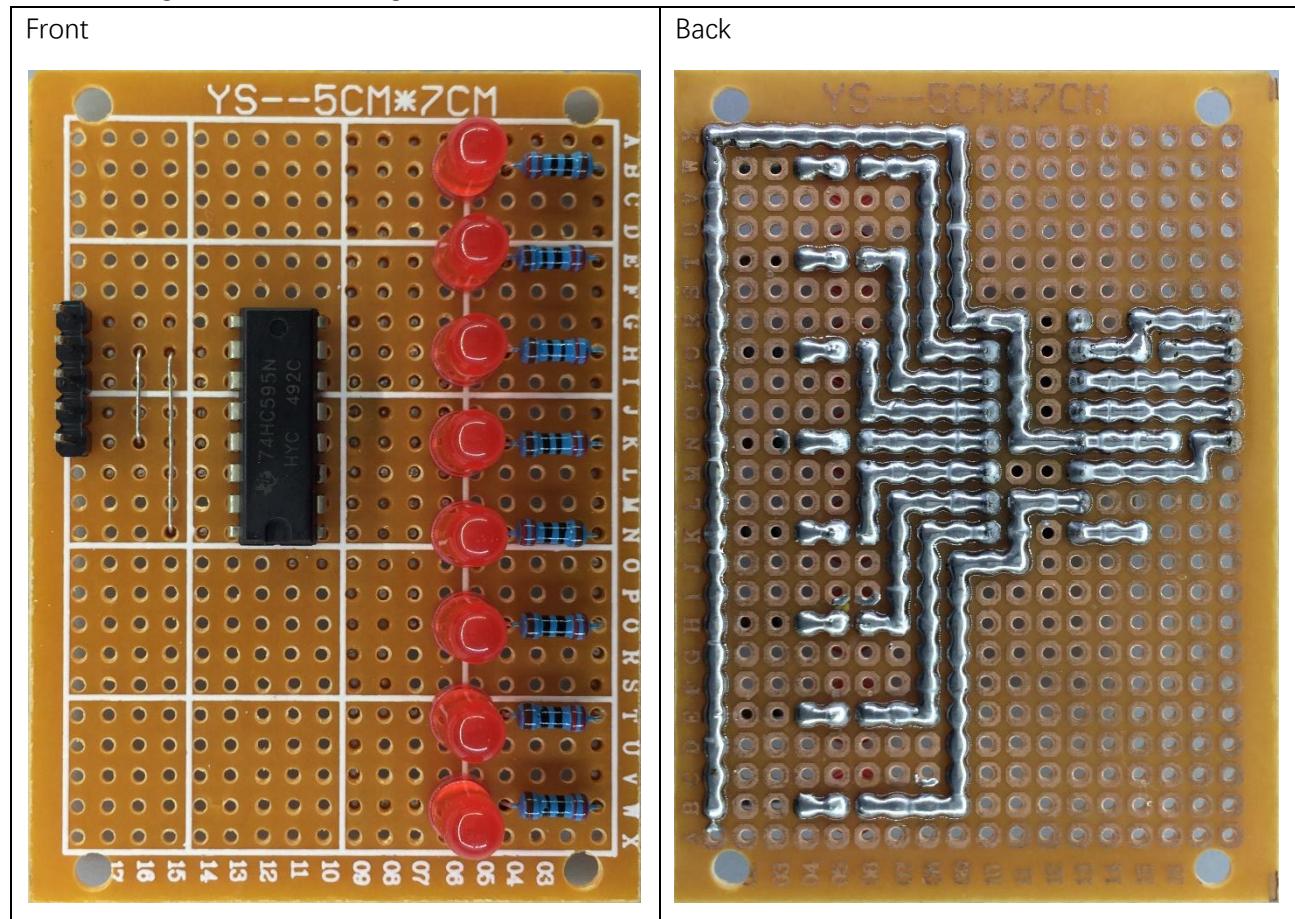

### Soldering the Circuit

Insert the components in the Perfboard, and solder the circuit on the back per earlier instructions.

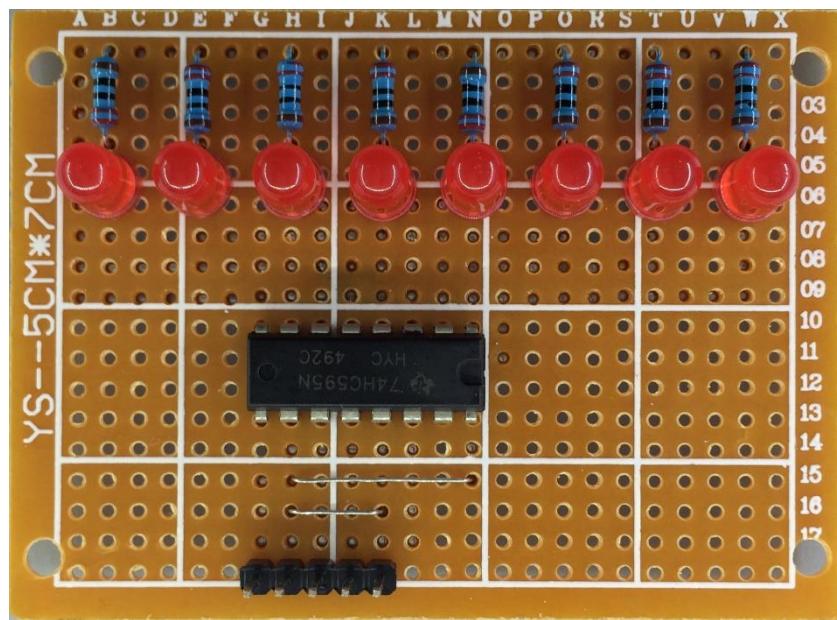

Here is a diagram after soldering from both sides of the Perfboard:

## Connecting the Circuit

Connect the board to Raspberry Pi with jumper wire in the following way.

DS	—GPIO.17
ST_CP	—GPIO27
SH_CP	—GPIO22
GND	—GND
VCC	—3.3V/5V

## Code

This now will be the third time we have made the Flowing Water Light. In this project, we will solder a completely new circuit for Flowing Water Light. Additionally, the program is also different from the previous ones we have used. When this light flows, it will have a long "tail".

### C Code 35.2.1 LightWater03

First, observe the project result, and then learn about the code in detail.

If you have any concerns, please contact us via: support@freenove.com

1. Use cd command to enter 35.2.1\_LightWater03 directory of C code.

```
cd ~/Freenove_Kit/Code/C_Code/35.2.1_LightWater03
```

2. Use following command to compile "LightWater03.c" and generate executable file "LightWater03".

```
gcc LightWater03.c -o LightWater03 -lwiringPi
```

3. Then run the generated file "LightWater03".

```
sudo ./LightWater03
```

After the program is executed, the LEDs will light up in the form of flowing water with a long "tail".

The following is the program code:

```
1 #include <wiringPi.h>
2 #include <stdio.h>
3 #include <wiringShift.h>
4 #include <unistd.h>
5
6 #define  dataPin 0 //DS Pin of 74HC595(Pin14)
7 #define  latchPin 2 //ST_CP Pin of 74HC595(Pin12)
8 #define  clockPin 3 //SH_CP Pin of 74HC595(Pin11)
9 //Define an array to store the pulse width of LED, which will be output to the 8 LEDs in
order.
10 const int pluseWidth[]={0,0,0,0,0,0,0,0,64,32,16,8,4,2,1,0,0,0,0,0,0,0,0} ;
11 void outData(int8_t data) {
12     digitalWrite(latchPin,LOW);
13     shiftOut(dataPin,clockPin,LSBFIRST,data);
14     digitalWrite(latchPin,HIGH);
15 }
16
17 void shiftOut(int dPin, int cPin, int order, int val){
18     int i;
19     for(i = 0; i <8; i++){
20         digitalWrite(cPin,LOW);
21         if (order == LSBFIRST) {
22             digitalWrite(dPin, ((0x01&(val>>i)) == 0x01) ? HIGH : LOW);
23             delayMicroseconds(10); // 10 times longer than earlier exercise
24         }
25         else { // if (order == MSBFIRST) {
```

```

26         digitalWrite(dPin, ((0x80&(val<<i)) == 0x80) ? HIGH : LOW);
27         delayMicroseconds(10);           // 10 times longer than earlier exercise
28     }
29     digitalWrite(cPin, HIGH);
30     delayMicroseconds(10);           // 10 times longer than earlier exercise
31 }
32 }
33
34 int main(void)
35 {
36     int i, j, index;    //index:current position in array pluseWidth
37     int moveSpeed = 100; //It works as a delay. The larger, the slower
38     long lastMove;        //Record the last time point of the led move
39
40     printf("Program is starting ... \n");
41
42     wiringPiSetup();
43
44     pinMode(dataPin, OUTPUT);
45     pinMode(latchPin, OUTPUT);
46     pinMode(clockPin, OUTPUT);
47     index = 0;          //Starting from the array index 0
48     lastMove = millis(); // record the start time
49     while(1){
50         if(millis() - lastMove > moveSpeed) { //speed control
51             lastMove = millis(); //Record the time point of the move
52             index++;           //move to next
53             if(index > 15) index = 0; //index to 0
54         }
55         for(i=0;i<64;i++) {           //The cycle of PWM is 64 cycles
56             int8_t data = 0;
57             for(j=0;j<8;j++){ //Calculate the output state
58                 if(i < pluseWidth[index+j]) { //Calculate the LED state according to the
pulse width
59                     data |= 0x01<<j ; //Calculate the data
60                 }
61             }
62             outData(data);           //Send the data to 74HC595
63         }
64     }
65     return 0;
66 }
```

We can see that this program is different from the previous one that we had used. We define an array to

modulate different PWM pulse widths for LEDs, in doing so different LEDs can emit varied brightness. Starting from the array index 0, take an array of 8 adjacent numbers as the LED duty cycle and output it one at a time. Increasing the starting index number in turn, then it will create a flowing effect.

```
const int pluseWidth[]={0, 0, 0, 0, 0, 0, 64, 32, 16, 8, 4, 2, 1, 0, 0, 0, 0, 0, 0};
```

By recording the moving time point to control the speed of the movement of index number, controls the speed of the Flowing Water Light. Variable moveSpeed saves the time interval of each move, and the greater the value is, the slower the rate of the flowing movement (the reverse creates faster flowing movement).

```
if(millis() - lastMove > moveSpeed) { //speed control  
    lastMove = millis(); //Record the time point of the move  
    index++; //move to next  
    if(index > 15) index = 0; //index to 0  
}
```

Finally, in a “for” loop with i=64, modulate the output pulse width of the PWM square wave. The process, from the beginning of implementing the for loop to the end, is a PWM cycle. In the loop, there is another for loop with j=8 and in this loop, it compares the number “i” to the value of the array to determine output high or low level. Then, the data will be sent to the 74HC595 IC Chip.

```
for(i=0;i<64;i++) { //The cycle of PWM is 64 cycles  
    int8_t data = 0; //This loop of output data  
    for(j=0;j<8;j++) { //Calculate the output state of this loop  
        if(i < pluseWidth[index+j]) { //Calculate the LED state according to the  
pulse width  
            data |= 0x01<<j; //Calculate the data  
        }  
    }  
    outData(data); //Send the data to 74HC595  
}
```

# Other Components

This kit also includes other common components that can help your ideas come true. Now we will introduce components not mentioned in the previous section.

## Component Knowledge

### Toggle switch

Like push button switch, toggle switch is also a kind of switching devices. The difference is that toggle switch is suitable for long-time open or close circuits.

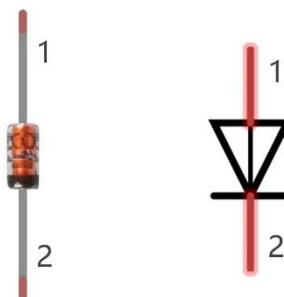

When the lever is moved to the left, pin 1, 2 get conducted, and pin 2, 3 are disconnected from each other;  
When the lever is moved to the right, pin 2,3 get conducted, and pin 1,2 are disconnected from each other;

### Switch diode

There are several types of diodes. We have used 1N4001 before, which is a common rectifier diode and commonly used in ac rectifier.

Here is 1N4148, which is a kind of high-speed switching diodes and is characterized by a relatively rapid switching.

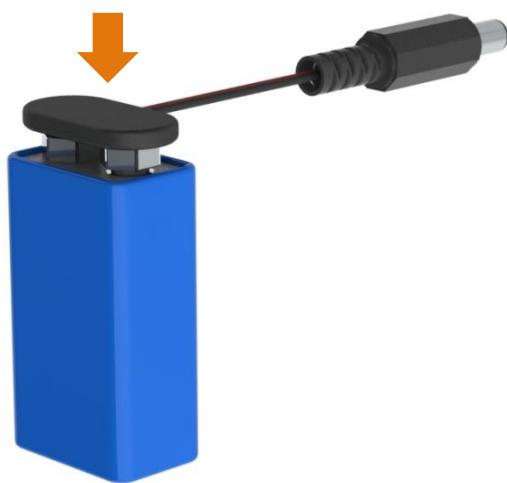

For the switching diode, the changing time from conduction to cut off or from cut off to conduction is shorter than general diode and it is mainly used in electronic computer, pulse and switching circuits.

### 9V battery cable

A 9V battery cable can connect a 9 V battery, which can supply power for control board.

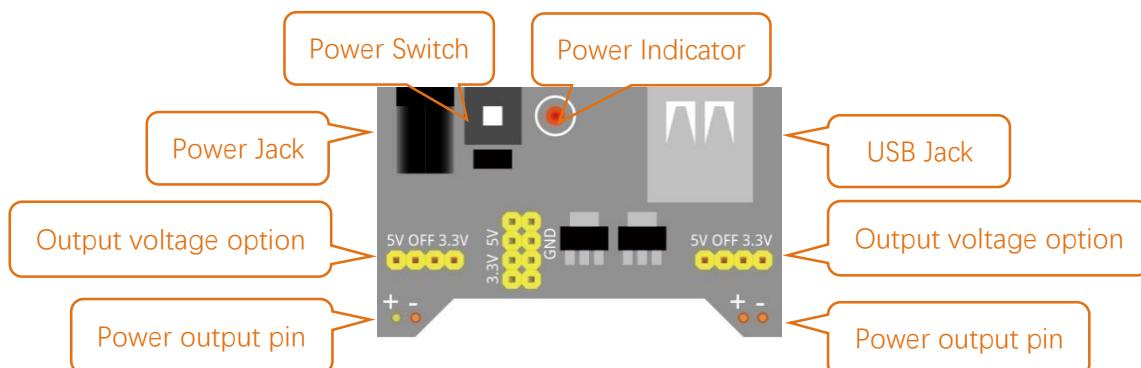

The installation of 9V battery cable is as follows:

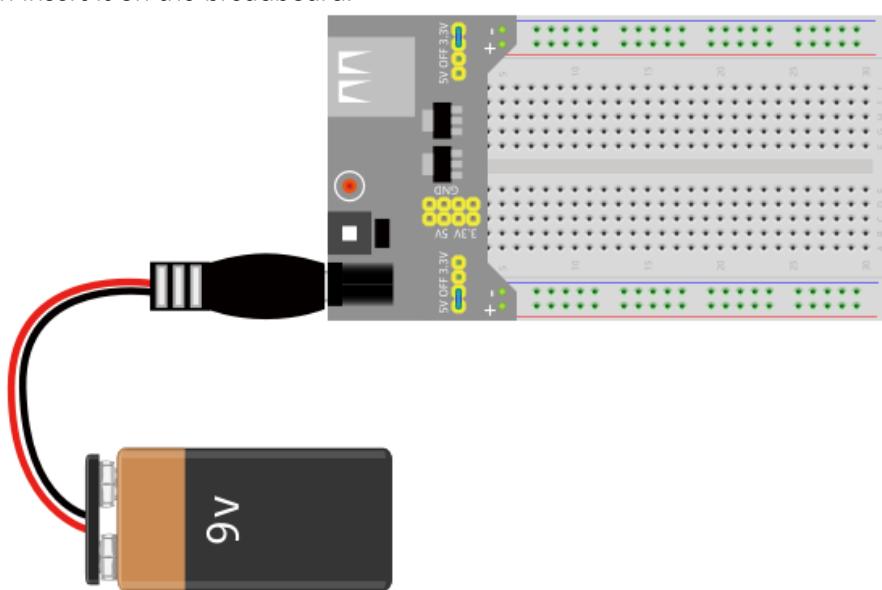

### Power supply module for breadboard

The following is the power supply module for breadboard. This module can provide the breadboard with two-channel power supply separately, and each can be configured to 3.3 V or 5 V separately through a jumper.

We can build a circuit conveniently by using this module. You only need to provide power supply for this module, and then insert it on the breadboard.

## What's Next?

THANK YOU for participating in this learning experience! If you have completed all of the projects successfully you can consider yourself a Raspberry Pi Master.

We have reached the end of this Tutorial. If you find errors, omissions or you have suggestions and/or questions about the Tutorial or component contents of this Kit, please feel free to contact us:  
[support@freenove.com](mailto:support@freenove.com)

We will make every effort to make changes and correct errors as soon as feasibly possible and publish a revised version.

If you are interesting in processing, you can study the Processing.pdf in the unzipped folder.

If you want to learn more about Arduino, Raspberry Pi, Smart Cars, Robotics and other interesting products in science and technology, please continue to visit our website. We will continue to launch fun, cost-effective, innovative and exciting products.

<http://www.freenove.com/>

Thank you again for choosing Freenove products.
